

WADI reaches its conclusion after four years of research and testing

Results are available in a webinar and a publication

© WADI Project

The WADI project comes to an end in July 2020, after a long four years of research, the implementation of two flight campaigns in France and Portugal, and a final evaluation phase performed by the partners. WADI is now preparing for a new phase: a group of partners have prepared a roadmap for the development of a full service in the future, to be commercialized later on.

During the month of June the project shared its main findings and results through a webinar, held on June 16th 2020 within the framework of the ICT4Water Cluster Annual Event. It was an important opportunity for WADI partners to meet with their stakeholders and present the achievements of the project.

The recording of the webinar is available for consultation and for anyone not able to attend it live.

For a more in-depth insight into the results produced by WADI, it is also possible to download and consult the project's final publication, available at this [link](#) . It will provide not only the technical ins and outs of the WADI service, but also an analysis on the environmental and societal impacts that the application of the WADI technology can provide.
