

Consortium

Gigascale Oriented Solid State fIAsH Memory for EuRope

Création : Comité : uniuur.comiteo.com

www.fp7-gossamer.eu

Project Coordinator:
Prof. Livio Baldi, Numonyx
livio.baldi@numonyx.com

With the support of Alma CG: +33 (0)4 72 35 80 30
Cédric ROBET - crobet@almacg.com

Industrial partners

Numonyx, Italy
Qimonda, Germany
ASM Europe BV, Belgium
Active Technologies, Italy
Jordan Valley, Israel

Management consulting

Alma Consulting Group, France

Research partners

IMEC, Belgium
CNR, Italy
Tyndall Research Centre, Ireland
IUNET, Italy
University of Freiberg, Germany
Fraunhofer CNT, Germany
University of Braunschweig, Germany

A European Integrated Project supported through the Seventh Framework Programme for Research and Technological Development.
Contract number: 214431

GOSSAMER An Integrated Project under FP7

Objectives:

To develop the Charge Trapping Technology for very high density Non Volatile Memories for mass storage, targeting the 22 nm technology node.

Start date: January 1st, 2008

Duration: 3 years

Memory for the mobile World

The need of more and more "memory" is shared by all applications of ICTs such as enhancing life comfort and security, leisure, education, business and improving work productivity.

At the moment there seems to be no sign for a slowing down of memory requirements: in spite of the doubling of memory density every 18 months, the diffusion of broadband communication and digital appliances, and the constant demand for better quality of images and sound, is creating an ever increasing need for large memories in a variety of new media.

Solid-state memories are the preferred solution for mobile applications. Their main advantages are the use of consolidated technology, the lack of any mechanical parts, which results in stronger ruggedness, lighter weight, smaller form-factor, better reliability and, above all, lower power dissipation.

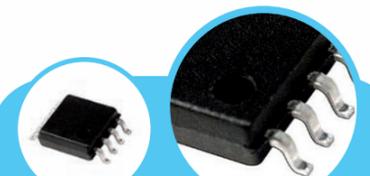

During the last 15 years, ICTs have provided a number of radically new devices / techno-toys that have improved the daily life of the EU citizen: mobile phone, digital camera, MP3 players, PC, PDA, credit cards, video on discs, flat screen, HD TV, fast communications (ADSL)...

And solid-state mass-storage today means NAND Flash memories

What are Flash?

Flash memory is non-volatile computer memory that can be electrically erased and reprogrammed. It is a technology that is primarily used in memory cards and USB flash drives for general storage and transfer of

data between computers and other digital products. Flash memory is non-volatile, which means that no power is needed to maintain the information stored in the chip. (Wikipedia)

Pushing the limits of Flash

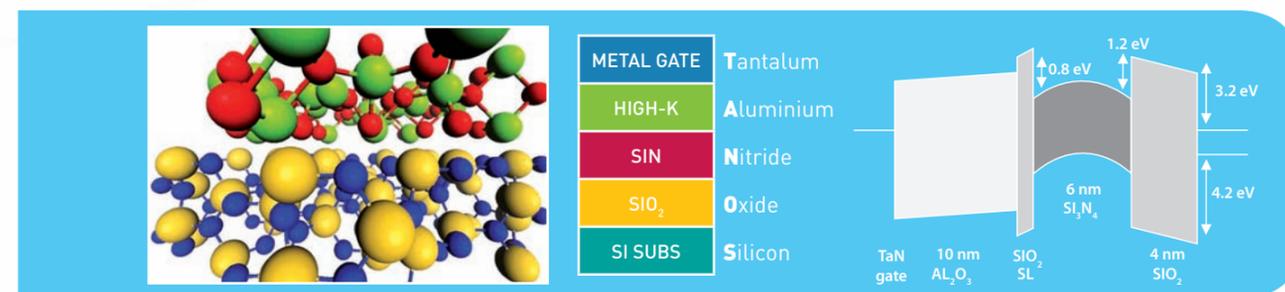

NAND Flash is by far the dominant technology for solid-state mass-storage. However, the floating gate concept is predicted to face technological limits around the 32nm node. The main physical limits that prevent further scaling of the cells are:

- cell to cell interference, due to the parasitic capacitive coupling among neighbouring floating gates;
- low coupling ratio with the control gate, which results also in a small stored charge.

On the other side, trap-related leakage currents in the dielectrics prevent any scaling of the cell dielectrics, which could relieve this issue. Further reduction of cell size will increase the requirements for error correction beyond the feasibility limits.

The most promising option to overcome these scaling limitations, while retaining the very high integration density of NAND Flash architecture seems to be the replacement of the conventional floating gate with a charge trapping layer.

Project Approach

The consortium is build around two major European semiconductor companies, Numonyx and Qimonda, with a strong experience and a technical leadership in different types of memories (DRAM for Qimonda and NOR Flash for Numonyx) and have a great interest for NAND Flash memories, because of their strategic importance for a variety of applications.

The consortium includes a balanced combination of all types of research performers: Large Industry, Small and Medium Industry, Research Centres and Universities

The key to the success of the project will be in the tight integration of allocated resources and their focalization, inside 7 Work Packages:

- WP0 Management
- WP1 Material Development
- WP2 Cell Architecture
- WP3 Process Integration
- WP4 Demonstrator
- WP5 Characterization & Reliability
- WP6 Higher density Architectures
- WP7 Dissemination & Training
