

SOCIABLE DELIVERABLE D4.4

“SOCIABLE Database Structure and Knowledge Base”

Project Acronym	SOCIABLE
Grant Agreement No.	238891
Project Title	Motivating platform for elderly networking, Mental reinforcement and social interaction
Deliverable Reference Number	SOCIABLE_WP4_D4.4
Deliverable Title	“SOCIABLE Database Structure and Knowledge Base”
Revision Number	V1.0
Deliverable Editor(s)	Singularlogic (SLG)
Authors	Stelios Pantelopoulos (SLG), Tsigoudis Michalis (SLG), Inmaculada Gomariz Soto (UPV), Paolo Mattarelli (CEDAF), Michele Fabbri (CEDAF), Simone Passuti (CEDAF)

Project co-funded by the European Commission within the ICT Policy Support Programme		
Dissemination Level		
CO	Confidential	CO

Statement of originality:

This deliverable contains original unpublished work except where clearly indicated otherwise. Acknowledgement of previously published material and of the work of others has been made through appropriate citation, quotation or both.

PROPRIETARY RIGHTS STATEMENT

Abstract

This deliverable illustrates the conceptual design and the implementation of the SOCIABLE database. The presentation of the relevant schemas and SQL scripts is performed on a per module basis, for the main modules of the SOCIABLE platform. The present report accompanies the prototype implementation of the SOCIABLE database and persistence layer as part of the SOCIABLE platform.

Executive Summary

The present report is part of deliverable D4.4, which deal with the persistence tier of the SOCIABLE platform. In particular it presents the main tables comprising the relational model of the SOCIABLE database. The later database is a crucial element of the SOCIABLE platform, given that it holds a wide range of data and metadata that are associated with the operation of the SOCIABLE ICT based model for cognitive training and social activation of elderly individuals. Such data include the records of the elderly users and patients, their scores in the scope of cognitive training games, pointers to the media files of the games, information (i.e. metadata) for the deployment and localization of the games, metadata for the management and personalization of the sessions, as well as information for the execution of the book-of-life application. Note that for the purpose of the SOCIABLE pilot service, a conventional relational database schema was judged sufficient. No other representations (e.g., XML representations, ontologies) were deemed necessary for the purposes of the platform implementation.

The SOCIABLE database can be represented by a complex conceptual schema (E-R diagram), comprising numerous entities and relationships. This schema is presented in this report in two parts: (a) One part dealing with the schema of the back-office database, which comprises all the entities relating to cognitive games, the surface shell and the management of patients and session data/information, and (b) A second part dealing with the schema of the Book-of-Life. These two parts provide a plausible segmentation of the conceptual schema. This segmentation serves the purpose of modular presentation in the scope of this deliverable.

Along with the conceptual schema, the present document includes the SQL scripts enabling the creation of the SOCIABLE schema. These scripts are included as an Appendix to this document. The gist of the SOCIABLE database schema is its actual implementation, which enables the conduction of the on-going SOCIABLE pilot operations. The implementation is included in the CD-ROM that accompanies this deliverable.

1. Introduction

SOCIABLE has introduced a new ICT based model for cognitive training of elderly individuals. The SOCIALE model is based on a surface computing platform, which consists of a number of software systems and applications that are provided over state-of-the-art surface computing hardware platform (such as the Microsoft Surface Table). The main goal of WP4 is to produce the software of the SOCIABLE surface computing platform, which includes:

- Shell applications that are customized to the needs of the SOCIABLE paradigm.
- A variety of cognitive training games, which correspond to the play activities that are executed during the cognitive training sessions.
- The book-of-life application, which is used by elderly individuals in order to enhance their social interactions.
- The back-office applications, which facilitate health professionals in managing the records and the sessions of the patients, while also producing relevant reports.

All the above applications persist and manage data within databases, notably relational database management systems, which form part of the SOCIABLE platform. These databases hold the data of the above application in multiple languages as illustrated in SOCIABLE deliverable D3.3 (which has provided the main localization specifications).

The purpose of this deliverable is to describe the design and implementation of the databases, where SOCIABLE data are persisted and managed. Note that a preliminary and partial database design has already been presented as part of deliverable D3.2 of the project. In this deliverable we delve into the details of the databases design and implementation, while also covering the full schemas supporting the SOCIABLE platform. The databases of the SOCIABLE platform are a critical element of the implementation, which is a prerequisite for the deployment of the platform, but also for any possible porting of the platform for use over other (alternative) surface hardware. Indeed, the schemas adopt the ANSI SQL standard, which make it usable across different SQL compliant RDBMS (Relational Database Management Systems).

From a presentation perspective, the deliverable provides a segmented presentation of the database schemas, according to the different modules comprising the SOCIABLE platform (i.e. infrastructure, cognitive games, book-of-life, back-office). The purpose of this segmented presentation is two-fold: (a) it provides a way for a modular and easier to understand presentation of the database and (b) it separates a large database schema into smaller schemas with (rather) disjoint semantics. The presentation of the various databases in this deliverable focuses on the schemas that were specified and implemented as part of the SOCIABLE project. It does not include any reference or presentation of third-party schemas (e.g., as part of the Microsoft Surface Table software) that may underpin the SOCIABLE platform and applications.

It should be noted that the SOCIABLE persistence layer does not include a knowledge base as originally envisaged. This is because during the design and specification of

the SOCIABLE platform, there was no apparent need for leveraging the properties of a knowledge base (e.g., XML representation, inferences etc.). Note also that the present document is the reporting part of the D4.4 deliverable. The deliverable includes also the prototype implementation of the databases of the SOCIABLE platform, which is provided in the form of appropriate scripts within an accompanying CD.

The structure of the deliverable is as follows: Section 2 following this introductory section, provides the conceptual design of the SOCIABLE database. Separate ER diagrams for the parts of the database schema that correspond to these modules are illustrated. Section 3 concludes the report. Note that the ER diagrams along with the SQL statements defining the respective tables are included/presented as Appendices to this deliverable.

2. Conceptual Design (SLG, UPV, CEDAF)

2.1 *ER-Model of the Back-office Database (cognitive games, shell application)*

The ER-Model of the Back-Office Database is reported in Appendix 1. Likewise the comprehensive SQL Tables Definitions of Back-Office and Games are reported in Appendix 2.

Here below we provide a list of the main tables with a short description for each, towards a quick and easy reference.

SOCIABLE main DB tables.

BOPersonnel

This table contains the personnel involved in the project: medical experts and assistant.

BORoles

This table contains the user's roles: patient, administrator, medical expert.

BOUsers

This table contains the system users allowed to login in Games, Back-office console and Book of Life.

BOUserRoles

This table contains the relation between Users and Roles.

BOMenuItems

This table contains the items of the back-office menus.

BOMenuItemsRoles

This table contains the relation between Roles and MenuItems; each role has access to a subset of menu item.

CTCognitiveSkills

This table contains the cognitive skills used to categorize games and patients. Examples of skills are memory, language, orientation.

CTGameCognitiveSkills

This table contains the relation between Games and Cognitive Skills. Each game will affect mainly a cognitive skill.

CTGame

This table contains description of all the SOCIABLE games.

CTGroups

This table contains the groups of the training program.

CTPatientCognitiveSkills

This table contains the relation between Patients and Cognitive Skills.

CTPatientSessions

This table contains the relation between Patients and Sessions.

CTPatientTest

This table contains the results of Patients Test execution; the table includes the scores obtained by Patients in Tests.

CTPatientTestResults

This table contains the Patients responses to questions of tests.

CTPatientTrainings

This table indicates which patients take part to programs.

CTPeriods

This table contains the periods of a program.

CTPrograms

This table contains the programs of the training; a program consists of games sessions.

CTSessionGames

This table shows which games are included in a game session.

CTSessions

This table contains games sessions planned and that has been carried out by patients.

CTTemplates

This table contains templates of game session; a template describes a typical game session.

CTTests

This table contains the assessment tests. Example of tests are "Mini Mental State Examination" and "Clock Drawing Test".

GEDevices

This table describes the hardware devices like Microsoft Surface or tablet PC.

GEPatients

This table contains data of all patients that take part in the trial; data includes name, surname and sex, years of schooling and other personal data.

GESurfaceTag

This table contains all available surface tag.

2.2 ER-Model Book-Of-Life Database

While user requirements are being researched and functional requirements are decided, UPV's development team has studied different communication strategies and graphic engines to be used in the project. The potential technologies that could be used for development were discussed with the rest of the partners.

Several technical tests have been completed in pursue of a web based videoconference for several users at same time. We have reached a number of three users sharing a conference (ie. Each user sees a pair of video frames).

Our team has designed an implementation plan for the development of the social activation services.

A first draft of the database design for the social activation services has been proposed and developed, and It is available in Annual Activity Report for SOCIABLE Partner, 01/05/2009 – 31/07/2010 .

Each patient, stored in **GEPatients**, can have one individual book and several group books, these relationships are shown through **SABooksOfLife**.

SABookOfLifePatients table links each Book Of life with each patient.

The Book of Life has several pages. The information is stored in **SAPagesOfBook**. Each page can be seen for all patients, my friends or anyone. The information is managed through **SA Visibility** and **SAPagesOfBook**.

Book of life allows the patient to make friends, and the information that is used is in the next tables:

- **GE Cities**
- **SA Patient Hobbies-SA Hobbies**

SAHobbies stores different types of hobbies. **SAPatientHobbies** allows the relationship between Hobbies and Patients.

Following is shown the last entity-relationship diagram (E-R) in which are represented the tables specially needed for the Book Of life and relationships.

SOCIABLE: Motivating platform for elderly networking, mental reinforcement and social interaction
 WP4- System Implementation, Integration and Test
 Deliverable D4.4: "SOCIABLE Database Structure and Knowledge Base"

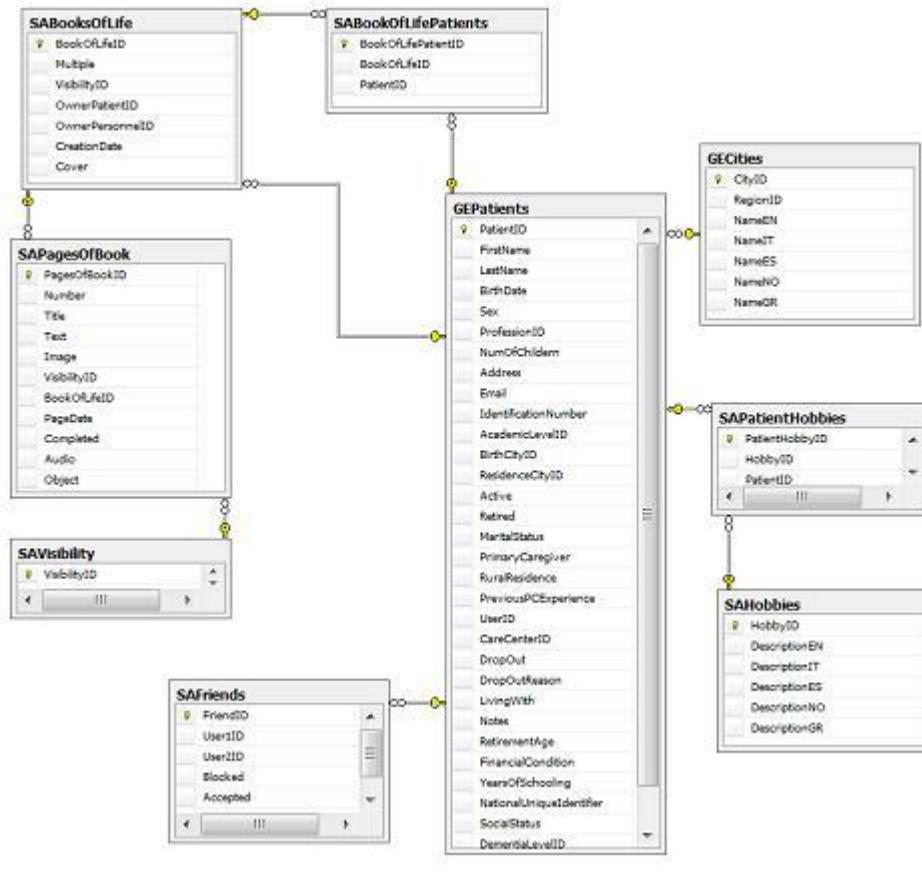

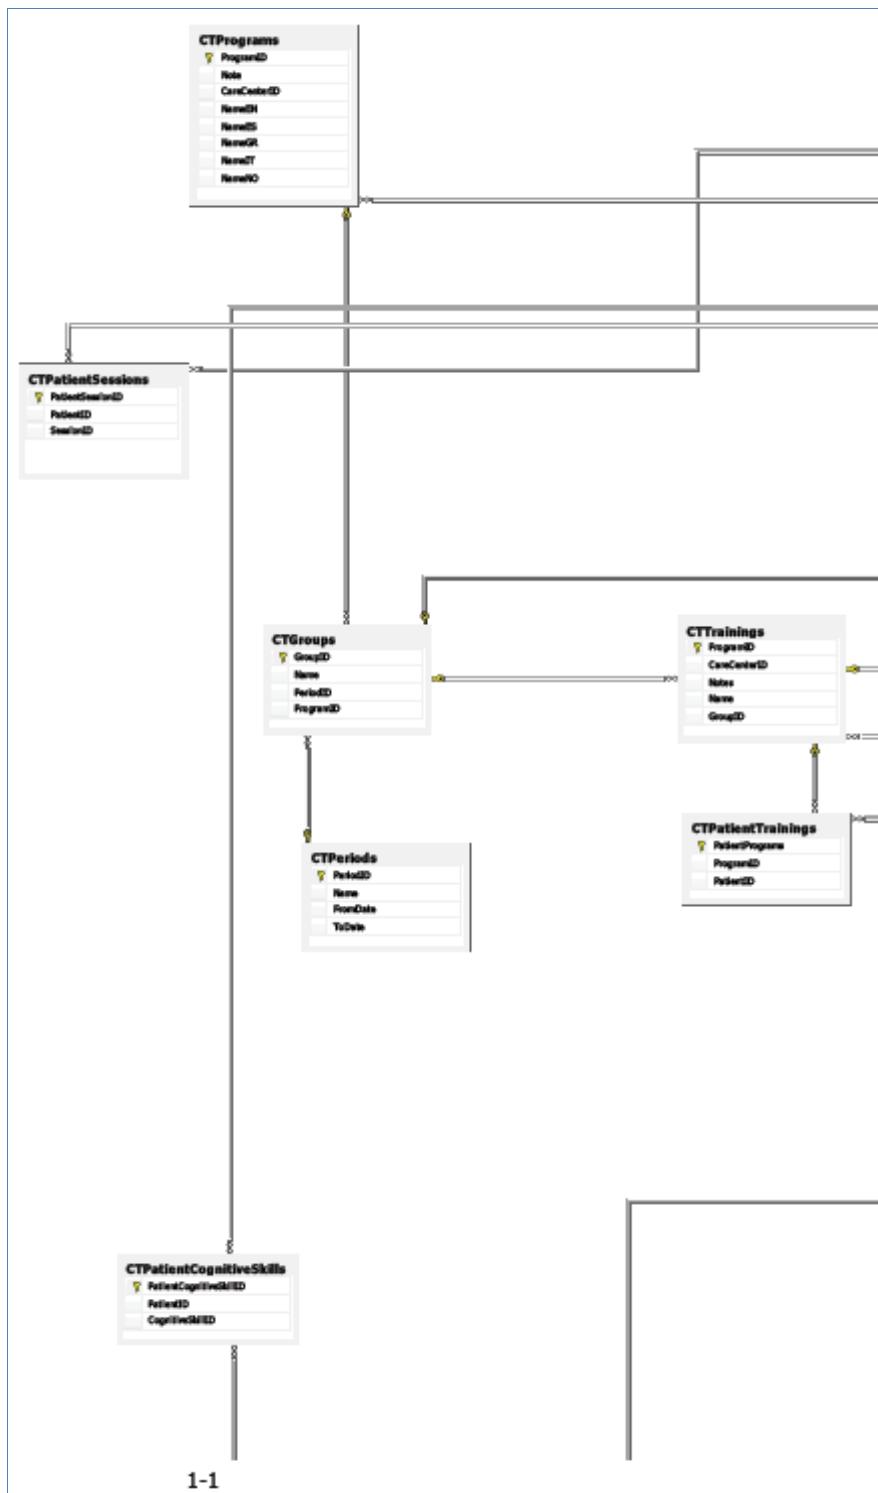

Figure 1: ER-Diagram (conceptual schema) used in the scope of the Book-of-Life application

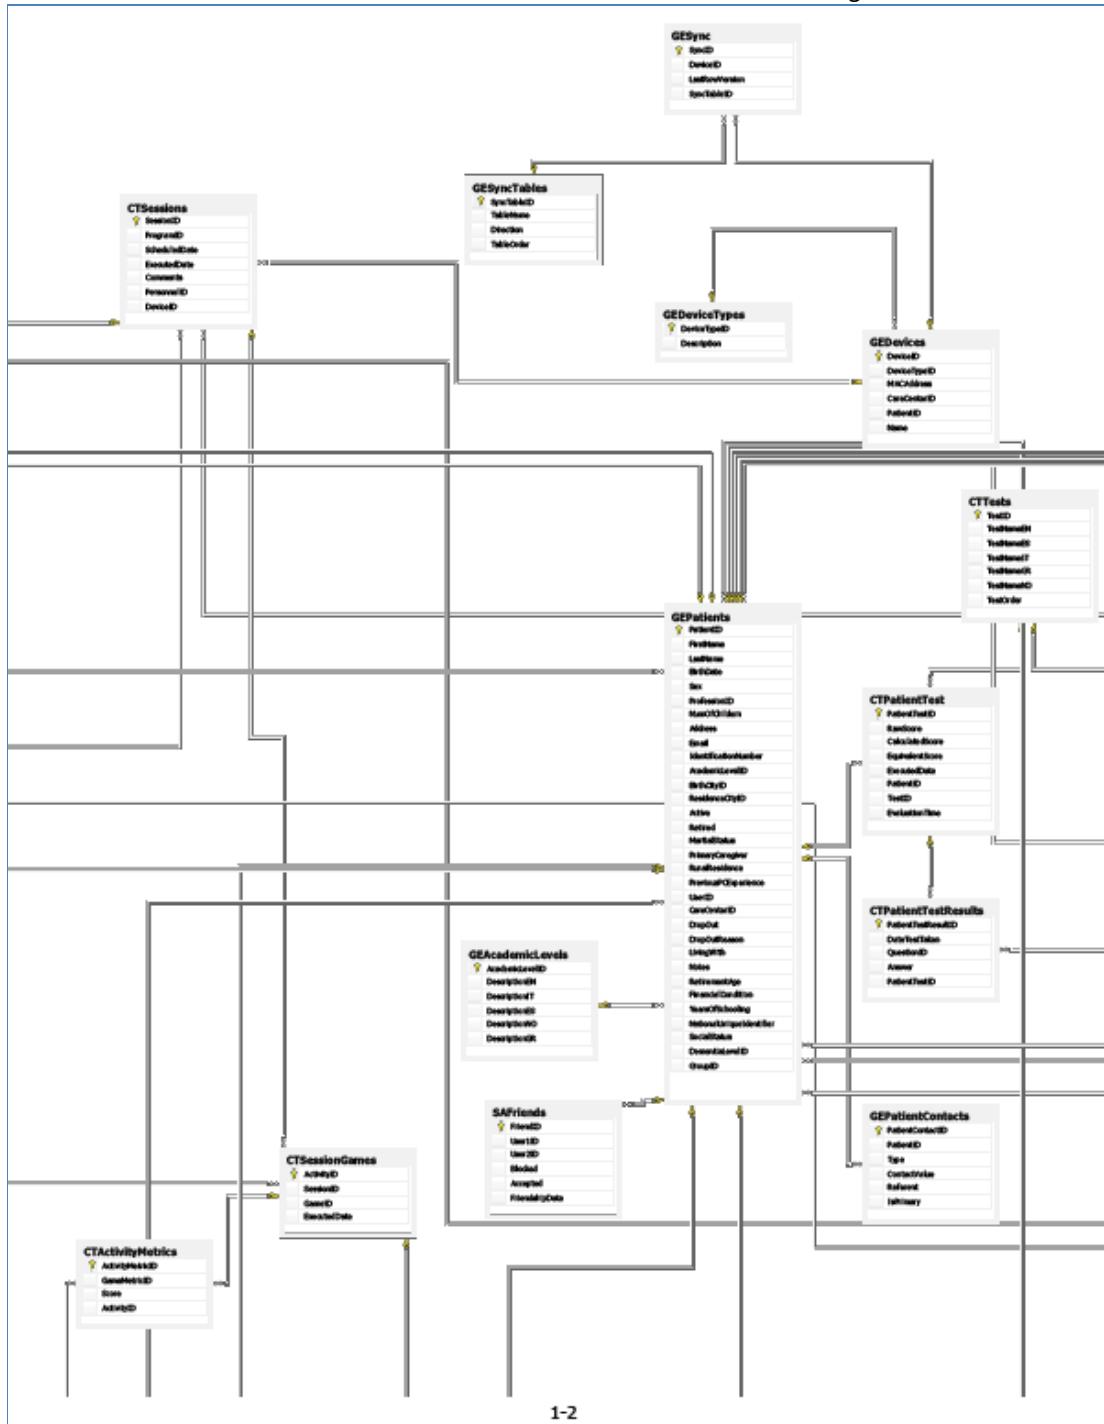

3. Conclusions

This deliverable has presented the conceptual design of the SOCIABLE database. This included the main entities of the SOCIABLE database, which holds and manages the full range of data and metadata that support the SOCIABLE pilot operations. The Appendices at the end of this deliverable provide also the SQL scripts that enable the creation of the table of the relational database, which state-of-the-art RDBMS systems.

Appendix 1 - ER model Back-office Database

The ER model of the Back-office database is presented in the following figures. Since the global schema is too wide to be inserted in a single figure, it has been divided in 6 parts.
