Executive Summary

This document is the Deliverable **D6.2: Platform Architecture and Design**, which, according to the Description of Work, has the following goals:

- describe the information and data models, the platform components, services, and applications, communication protocols;
- describe the integration model that enables various platform modules to interact with each other.

This deliverable will be updated as necessary during the lifetime of the project, to reflect the current status of the design, as part of the documentation accompanying the planned releases of the platform implementation (D6.3 at month 12, D6.4 at month 24, and D6.5 at month 36), in order to provide the necessary information to proceed through the three deployments foreseen for the SmartH2O platform.

The deliverable is structured as follows:

- **Section 1** recalls the essential concepts at the base of the design of the SmartH2O platform.
- **Section 2** illustrates the revisions to the data model underlying the platform; the description extends the original data model, presented in the deliverable D3.1 Database of user information.
- **Section 3** contains the specifications of the main components of the platform:
  - The Water Utility Customer Portal (section 3.3)
  - The Gamification Engine (section 3.4)
  - The Games Platform (section 3.5)
  - The Enterprise Service Bus (section 3.6)
  - The Smart Meter Data Manager (section 3.7)
  - The Portal Data Exchange Manager (section 3.8)
  - The Water Utility Admin Portal (section 3.9)
  - The Authentication Gateway (section 3.10)
  - The preliminary specifications of the Pricing Engine, Agent Based Modelling, and Models of User Behaviour components conclude the section; they will be expanded following the progress in the technical work.
- **Section 4** describes the deployment architecture: in particular how different technologies interplay in the implementation of the Service Oriented Architecture of SmartH2O.
- **Section 5** concludes the deliverable with an outlook on the next steps in the design of the SmartH2O platform.
- At the end of the deliverable, after the References section, Annexes provide additional technical information on:
  - **ANNEX 1 (Section 7):** The list of languages, frameworks and technologies used in the platform development.
  - **ANNEX 2 (section 8):** after a brief introduction to the OMG Interaction Flow Modelling Language [Bramb2014] (the UML profile for interaction flow specification in interfaces) the specifications of the SmartH2O front-end are given, divided in three subsections: Section 8.1, Section 8.2, Section 8.3 contain the interaction flow diagrams for the front-end of the SmartH2O platform, according to the IFML OMG standard.
1. Introduction

The SmartH2O project is developing an ICT platform for improving the management of urban and peri-urban water demand, based on the integrated use of smart meters, social computation, and dynamic water pricing, powered by advanced models of consumer behaviour.

The SmartH2O platform can support the cooperation of water utilities, municipalities and citizens to implement better water management practices and policies, leading to a reduction in water consumption, without compromising the quality of life, and to an increase in resource security.

The SmartH2O project must be able to:

- Understand and model the consumers’ current behaviour on the basis of historical and real-time water usage data;
- Predict how the consumer behaviour can be influenced by various water demand management policies, from water savings campaigns, to social awareness campaigns, to dynamic water pricing schemes;
- Raise the awareness of water consumers on their current water usage habits and their lifestyle implications and to stimulate them to reduce water use.
- Integrate with other systems, such as the portal of the utility company or a digital game platform, in order to provide a coherent experience to the water consumer.

The SmartH2O ICT infrastructure will thus enable water managers to close the loop between actual water consumption levels and desired targets, using information about how the consumers have adapted their behaviour to the new situation (e.g. new regulations, new water prices, and appeals to water savings during droughts). This feedback will then allow water management companies and decision makers to aptly revise the water demand management policies, enabling to maximise the water and energy saving goals.

Figure 1, originally provided in the SmartH2O description of work, describes the envisioned flow of information and control supported by the SmartH2O platform.

The behaviour of a water user is gathered by collecting data on its water consumption by means of smart meters and, at the same time, by an online social participation application (the social game) where qualitative information about the user preferences and attitudes are collected. This information is processed and the user is "profiled" in order to produce a synthetic user behaviour model, which will be then fed in an agent-based simulation model.

The social participation applications are then also used to deploy policies in the real world. The consumers will receive signals, such as incentives to save water in specific environmental conditions, or such as dynamic price information. Once the policies are deployed, the SmartH2O platform allows continuous monitoring of the users’ aggregate behaviour, i.e. their water consumption, in order to suggest other actions if the original policy loses effectiveness.

This deliverable reflects the current status of the design of the technical components that map the data and control flows depicted in Figure 1 into a concrete technical space, assigning computation and integration responsibility to core software modules.

For each core module, this deliverable reports the essential technical use cases and interface that the module supports. The technical use cases must be interpreted as a derivation of the high-level use cases described in the requirements deliverable: D2.1 Use cases and early requirements. They embody the flow of messages, queries, and service calls that support the actual execution of the user-oriented usage scenarios specified in D2.1.
Figure 1: The flow of information and control in SmartH2O.
2. Data Model Structure

In this section we describe the updated version of the SmartH2O database, previously defined in deliverable D3.1 Database of User Information. Such updates stem from the progress in the specification of the user’s requirements and of the system architecture, which prompted for the refinement of aspects mostly related to the user’s profile data.

Figure 2: User Groups Relational Model.

Figure 2 recalls the data model for implementing Role Based Access Control (RBAC). Users are clustered in Groups, which represent the various classes of users. Groups are connected to Modules, which represent the interfaces to the SmartH2O resources that the class of users is entitled to access.

2.1 Consumer Data Model

According to the early mock-ups and functional requirements illustrated in D2.1 Use cases and early requirements, a series of changes have been made to the Consumer Data Model proposed in the deliverable D3.1 Databases of user information.

The resulting updated schema is reported in Figure 3:
In order to provide more appropriate and targeted incentives, users are grouped into consumer segments, using algorithms provided by the Models of User Behaviour component. The following entities have been introduced:

- **Consumer Segment**: each segment is identified by unique id, a name and a description. A segment of users is characterized by a set of features.
- **Feature**: each feature refers to a specific consumer segment, and it is identified by a unique id, a type and a level (e.g. Consumption Average: medium, Environmental Commitment: high).
- **Users Segments**: this entity stores the members of each user segment.

In order to encourage a rational use of water some tips are provided to the consumers. The following entities have been introduced:

- **Tip**: each tip is identified by a unique id, a name and the text content divided into a header and a body.
- **Tip Tracking**: this entity keeps track of the tips which have been provided to a user.

In order to warn users about possible leaks or bad water quality, alerts will be provided. The following entities have been introduced:

- **Alert**: each alert is identified by a unique id, a type (e.g. Water Quality Alert, Leakage Alert, Shortage alert), a level (e.g. low, medium, high) and the receiver user id. When a new alert is inserted, the current date is stored in order to keep track of the progress of a particular type of alert and to record past critical situations. However the latest alert of a given type will be provided to the user.
- **Mail**: an alert can be associated to a mail, in order to directly notify the user. Each email is identified by a unique id, a description, the subject of the email, the body of the email and the language.
The system deals with different physical quantities (e.g. water consumption, temperature). In order to take into account the different units of measurement used in different countries, the system will store them in order to make the correct unit conversions. The following entity has been introduced:

- **Unit Of Measurement**: each unit conversion is characterized by a unique id, the primary unit of measure, the secondary unit of measure and the coefficient to be applied in order to perform the conversion.

The system can also display water info material like videos, providing information about topics related to water saving. The following entities have been introduced:

- **Media Asset**: each media object is identified by a unique id, a title, a description, the author, the duration of the video and the URL of the media object.

Additionally some attributes have been introduced in the following entities:

- **House**:
  - Public: a flag stating if the house holder user agrees that his/her family is involved in a public competition and consents to appear in the public leaderboard (D2.1: use case 9.19).
  - Visible: a flag stating if the house holder user consents to disclose information about his house location to other users (D2.1: use case 9.21).

- **Neutral User**:
  - Currency: the currency selected by the user, which will be associated to the bill quantities.
  - Language: the language of the user.
  - Temperature Unit and Length Unit: the units of measurements selected for a given user.
  - Public: a flag stating if the user agrees to participate to the competition and to appear in the family leaderboard (D2.1: use case 9.17).

- **Bill**:
  - Currency: the currency of a given bill.
  - Volume Charge and Service Charge: they are needed in order to be able to sort bills and compare them.
  - Exchange Rate and Exchange Date: they are needed in order to store the conditions at the time when the bill was emitted.

### 2.2 Gamification Data Model

According to the early mock-ups and functional requirements, the changes illustrated in the following have been made to the Gamification Data Model proposed in the deliverable D3.1 [Bozzon2014, Karam2012].

The resulting updated schema is depicted in Figure 4.
In order to allow the Content Editor of the Gamification Engine portal to organize actions and badges according to topics, the thematic area entity has been introduced:

- **Thematic Area**: each thematic area is identified by a unique id and a name. Each action or badge belongs to a specific thematic area.

In order to allow the Content Editor of the Gamification Engine to define the rules for the actions coming from game results, which are involved in the gamified competition, the following entities have been introduced:

- **Game Result**: each game result is identified by a unique identifier, a title (e.g. New Level Reached) and optionally by a score, a level and the current available lives. Each game result is mapped to an Action Type and, according to the game results attributes (score, level, lives) the game result is converted into gamification engine credits.
- **Game Points Converter**: each conversion is identified by a unique id, the game to which the conversion rule is applied, and the customizable formula which will take the attributes as inputs (score, level, lives) and will produce gamification credits as output.

The application will provide water-saving goals to the users, to be achieved by performing different actions. Users can also form coalitions, inviting the rest of his family to join, and save water collaboratively with friends, family and neighbours. The following entities have been introduced:

- **Alliance**: each coalition among competitor users is identified by a unique id, a start date and an end date.
- **Alliance Members**: this entity stores the members of each alliance.
- **Goal**: each goal is identified by a unique id, a title, a score, and optionally the completion date. A goal can be assigned to a given user or to an alliance of users.
- **Goal Actions**: this entity stores which actions can be performed by users to achieve a particular goal.

### 2.3 Games Platform Data Model

Figure 5 illustrates the schema of the database supporting game data persistence [Bozzon2014, Karam2012].
**Figure 5: Games Platform Relational Model.**

Game is the core entity: the Mode attribute represents the gameplay modes (e.g. Single Player, Multi Player, Cooperative), while the Genre attribute identifies its genre (e.g. Puzzle, Educational). Each game is also characterized by a Title, a Theme and the Minimum/Maximum number of players.

An Achievement has an Icon, which describes it in a visual way, a Category that specifies the task (Instructor, Grinder), an attribute PointsGiven, which contains the amount of points to be granted, and a Boolean attribute OfTheDay defining whether the achievement has to be completed on a specific day in order to obtain virtual goods, more points, or increased levels.

The Player entity accommodates game-specific personal and social features. Avatar and Nickname allow the user to be recognizable by using a custom image or a unique fictional name, while Player Type, Player Level and Experience Points convey player progress. Reputation in online gaming communities is fundamental and distinctive feature of any player; being able to recognize whether a player is bad mannered, prone to cheating, unpleasant to play with is of utterly importance to assure a satisfying gaming experience for the user of an entertainment platform; it is usually measured as an integer number ranging from 0 to 5.

The model describes also the game-relevant statistics (GameStats): the proficiency and the experience of a player in a given game are represented by aggregating in a compact way
such indicators as points gathered and hours spent playing.

**GameBadges** represent the achievements that have been unlocked by a player. The *CompletionPercentage* field shows how much the player has already achieved in a specific task. *StartDate* and *EndDate* record the dates in which the player has started to work on the achievement's goals and the date in which he has obtained it. The *TrialsN* attribute tracks how many times the user tried to fulfill the achievement.

A **GamePlayAction** of a player, associated with a specific **Gameplay**, records the *StartDate* and *EndDate* of the gaming session and the actual actions performed by the player on that specific time frame and the *Role* defines which are the allowed actions in the game for the role associated to a player.

In order to store questions and answers required by the Drop!TheQuestion trivia game, **Question** and **Answer** entities have been provided. **QuestionInstance** keeps track of players game play information related to the specific quiz game.
3. **The SmartH2O architecture specification**

The SmartH2O platform is a distributed architecture for brokering data and services among a variety of heterogeneous systems and users, supporting the flows depicted in Figure 1.

3.1 **Specification of the user groups**

To better understand the nature of the user interfaces visible in Figure 10, Figure 6 recalls the taxonomy of the various user roles identified in the requirement analysis, as reported in *D2.1 Use cases and early requirements*.

![User groups taxonomy](image)

**Figure 6: Taxonomy of the user groups in SmartH2O (from D2.1 Use Cases and Early Requirements).**

A first distinction among user groups is between **Consumer** and **Admin**: the former is the generic user who can access the services provided by the SmartH2O platform; the latter is instead in charge of managing the services provided by the SmartH2O platform.

**Consumers** are partitioned into sub-groups based on which services they access.

- **Player users** are the ones who play the Games provided by the SmartH2O platform. They can be:
  - **Casual Players**: they are not registered visitors interested in playing a game.
  - **Registered Players**: they are registered to the Games platform.

- **Customers** are users registered to the Consumer Portal, who access in order to monitor their water consumption and water bill. They can be:
- **Smart metered** users: they are customers having smart meters system installed in their house. The water meter measures the customer’s water consumption automatically.

- **Standard metered** users: they are customers not having smart meters system installed in their house. They need to manually input consumption data into the gamification engine.

- Inheriting properties from both Smart metered and Standard metered consumers, we find the following specialisations:
  - **Competitor** users: they are the ones who accepted to participate to the gamification mechanisms, including execution of actions, acquisition of badges and redemption of rewards. A competitor can be a:
    - **House holder** user: he/she is the responsible of a specific house. He/She can add other family members to the Gamification Engine and create collaborations with neighbours.
    - At the bottom of the hierarchy, inheriting from House holders, Competitors and from RegisteredPlayers, we find:
      - **CustomerPlayers** are users who are registered both to the Gamification Engine and the Games Platform. They have the possibility to collect points either by performing actions provided in the gamification engine or by playing the available games.

**Admin** users are partitioned into sub-groups based on which services they manage.

- **Content Editors** are administrators in charge of creating the content of the applications composing the smart water system.
  - **Gamification Engine Content and Rules Editors**: they are in charge of creating the content related to the gamification platform (the one used by Competitor users) such as actions, rewards and goals. They are also in charge of defining the rules to assign the suitable amount of points to each action.
  - **Consumer Portal Content Editors**: they are in charge of creating the content related to the platform used by Customer users, such as tips to improve water saving, teaching videos.
  - **Games Platform Content Editors**: they are in charge of creating the content related to the games, such as the questions provided in a quiz game related to generic water consumption topics.
    - **Utility Games Platform Content Editor**: they are a specialization of the Games Content Editor users, related to a specific utility game. For example they manage the specific questions provided in a quiz game.

- **Supervisors** are administrators in charge of monitoring and managing system data. They can be:
  - **Consumption Supervisor**: they are in charge of modelling user’s consumption.
  - **Gamification Engine Supervisor**: they are in charge of profiling users, making available users clusters that can be used to suggest the most suitable actions to perform.

Figure 7, Figure 8 and Figure 9 show the essential UML class diagram that represents the user groups that implement the taxonomy of Figure 6.
Figure 7: User groups class diagram.
Figure 8: Consumer group package class diagram within user groups.
3.2 Overview of the architecture components

Figure 10 illustrates the main components that constitute the SmartH2O platform.

The **SmartH2O Database** is the central repository of the information that is either common to all the SmartH2O components or supports the coordination and exchange of messages among them. Not all the data of SmartH2O will reside in the SmartH2O database; for example, commercial data about the water consumers maintained by the water utility will be stored in the proprietary systems of the company.

The **Enterprise Service Bus** (from now on, ESB) is a middleware layer that supports the loose coupling of the SmartH2O components; it permits the publication of their interfaces (Application Programming Interfaces, APIs) and the synchronous and asynchronous communication among components. The goal of the ESB is to decouple the heterogeneous components of the SmartH2O platform as much as possible, to support the extension with new services and functions and the rapid adaptation of the platform to new contexts (e.g., other utility companies with different IT standards and information systems).

The **Smart Meter Data Manager** deals with the acquisition of data streams from smart meters and with their consolidation within the SmartH2O database. It implements the data privacy and security policy of the utility company and ensures that only admissible (e.g.,
aggregated, anonymised) data is stored within the platform database.

The **Water Utility Consumer Portal** is a component, typically embedded within the proprietary portal services of the utility company, which supports the interaction between the utility customers and the SmartH2O awareness functionality. The integration is lightweight: the consumer will navigate from the standard GUI of the utility company to what she sees as a special section of the portal, where she can access the awareness tools and interfaces developed by SmartH2O.

The **Water Utility Admin Portal** is a component, integrated within the proprietary portal services of the utility company, which supports the work of the supervisor in the analysis of the water consumption data and of the outcome of the gamification rules; it also supports the work of the content editor, who administers the content (e.g., tips, articles, news, etc.) published to the customers. The portal also offers interfaces to the water utility operators to run simulations, based on the models embodied in the Models of User Behaviour component and on the algorithms implemented in the Pricing Engine and in the Agent Based Modelling component.

The **Portal Data Exchange Manager** deals with the data exchange communication that occurs "behind the scenes" among the SmartH2O platform and the third party applications already supporting the interaction with the various types of users. Such applications may comprise the “standard” customers’ portal of the utility company, or a B2E application for the utility company’s supervisors.

The **Gamification Engine** is a back-end component that embodies rules for transforming users’ actions into gamification scores and achievements. It is exploited in order to “gamify” the water consumption of the users, according to the awareness approach implemented by SmartH2O. It has an interface for the end-user, who sees the results of her water consumption actions; and administrative interfaces for the utility company’s managers and operators, who can supervise the outcome of the awareness policies and define the rules that reward the actions of water consumers.

The **Games Platform** supports the execution of all the digital games of SmartH2O, including the games that are played as part of the interaction with the Drop! board game (for a description of the current status of the social awareness applications, including the SmartH2O games, see deliverable *D4.1: First social game and implicit user information techniques*). The Games Platform must also support casual players, and thus has an independent users’ registration procedure, as well as a procedure for enrolling users that are already registered in the Utility Portal. The Games Platform exposes two kinds of interfaces: one or more digital games directed to the end users; an administrative interface, directed to the content editors of the game platform. The GUIs are served by a local database (the Games DB), which stores information that is pertinent only to the game play (e.g., the gaming history of players not registered in the Utility Portal).

The **Pricing Engine** allows water utility companies to assess the impact for various dynamic pricing algorithms on their customer behaviour. The pricing engine will use consumption data, user profile data, external input like meteorological data, water supply forecast. The Pricing Engine will model the user elasticity to different pricing schemes and it will be able to report how pricing stimuli can impact aggregate customer behaviour. The Pricing Engine also allows the Consumer to estimate the cost of its water use according to different pricing schemas, ranging from the actual tariff, to various simulated tariffs, which are evaluated in the SmartH2O project.

The **Models of User Behaviour** component contains models and algorithms for profiling the behaviour of water consumers. It contains a classification algorithm that creates user segments (classes of users with similar behaviour) on the basis of their features. It also contains a disaggregation algorithm that can attribute the end uses of the total amount of water used by a household during one day, with a certain degree of approximation. This algorithm is also used to identify the relevant features to be used in classification. Through the use of the SmartH2O platform supplemental features will be generated, such as the influence of social awareness (obtained by the Gamification component) or the sensibility to price changes (obtained by the pricing engine).

In summary, through this component, the water utility can visualize the water consumption of
each customer at a fixture/appliance level, in order to identify consumption patterns and
trends, and thus identifying the most promising areas where conservation efforts may be
polarized. For a description of the algorithms exploited to model the user behaviour, see
deliverable D3.2: First user behaviour models.

The **Agent Based Modelling** component allows the water utility to simulate whole districts of
users, thus extrapolating user models provided by the Models of User Behaviour component
at a larger scale and also extrapolating the impact of network effects due to users’
interactions, both in the physical and in the virtual world. The agent based model includes
influence/mimicking mechanisms and social interaction among the consumers, and thus will
be employed by the water utility to understand how some user types (leaders/influencers) can
stimulate a behavioural change on other users.

The **Authentication Gateway** component centralizes user registration into the SmartH2O
platform database for the users registered in the components having own user database.

Also, this component provides an unique point for authentication to all the users primarily
registered at a component level, in order to allow logging in to other components by using the
original set of credentials without the need to perform another registration.

The **Social Network Crawler and Data Analyser** component allows the platform, where
deemed appropriate by the water utility portal, to launch social data analysis campaigns to
identify relevant users and content in the area of sustainable water consumption. For
example, this component supports the crawling of Twitter data in order to automatically find
people and content relevant for a thematic area, such as water consumption.

The **Social Network Connector** component has a dual role with respect to the Social
Network Crawler and Data Analyser; it allows the Consumer, Player, and Competitor users to
post their achievements from the SmartH2O Water Utility Portal and Games Platform to the
social network of their preference, in order to engage people from their social circle to the
water consumption and sustainability campaigns of the water utility company.
3.3 Water Utility Customer Portal

This component includes:
- the **Utility Portal** in which the user can see his household consumption, water saving tips and alerts, and water saving educational content. This UI integrates inputs from different components (e.g. the smart meter data management)
### Component Name
*Water Utility Consumer Portal*

**Leader**
POLIMI  

**Partners**
SETMOB  

**Goals**
The component manages the visualization of the water consumption status for a Customer User

**User use cases**
- 8.2 Use case: Collecting consumption data  
- 8.3 Use case: Manually collecting consumption data  
- 8.6 Use case: Utility Portal Signup  
- 8.7 Use case: Visual exploration of water consumption information  
- 8.8 Use case: Visual exploration of water consumption at fixture/appliance level  
- 8.9 Use case: Providing water consumption alerts  
- 8.11 Use case: Providing water consumption tips  
- 8.12 Use case: Modifying User Settings  
- 8.13 Use case: Utility Portal Unsubscription

**Provided Interfaces**
This component is a web application, which integrates inputs from external sources. It does not provide interfaces to other components.

**Dependencies / Required Interfaces**
The component requires the implementation of the following interfaces:
- [GET]user(userid): returns all the metadata for the specified user  
- [GET]exists(userEmail): returns true if a user with the specified email exists, false otherwise  
- [GET]billByUser(userId): returns a short recap of the bill for the logged user  
- [GET]waterConsumptionStatisticsByUser(userId) returns the statistics of water consumption for the logged user  
- [GET]tips(userId): returns a list of tips for a specified user  
- [GET]waterUsageAlerts(userId): returns the list of usage alerts for the logged user  
- [GET]mediaContent(userID): videos, tutorial etc: may depends on the users  
- [POST]signup: pushes a registration to the SmartH2O DB  
- [POST]unsubscribe: remove a registration to the SmartH2O DB  
- [POST]updateUserProfile: updates user profile information like: family members, house configuration, appliances etc..

### 3.3.1 Main Use Cases

**Use Case 1.1: House Holder Signup**
### Use Case 1.1: House Holder Signup

<table>
<thead>
<tr>
<th><strong>Goal in Context</strong></th>
<th>The consumer performs a registration to the Water Utility Customer Portal, his data are saved into the SmartH2O DB.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Precondition</strong></td>
<td>The consumer is a client of the utility that manages the portal.</td>
</tr>
</tbody>
</table>
| **Success Condition** | **End**  
The user becomes a Customer user, who can access the Utility Portal.  
The consumer is correctly saved into the DB. |
| **Failed Condition** | **End**  
- A registration with the specified email already exists, this registration is cancelled and the user is notified.  
- The provided Utility Code does not exist or does not match the user information; this registration is cancelled and the user is notified. |
| **Primary actors**  | Customer, UtilityPortal |
| **Secondary Actors** | ESB, SmartH2ODB, Authentication Gateway |
| **Steps** | - the Customer requests the registration UI  
- the Customer fill and send the registration form  
- Water Utility Customer Portal verifies if the email was already registered  
- Water Utility Customer Portal verifies if the Utility Code exists and is valid  
- Water Utility Customer Portal saves the new user into the SmartH2O DB |
| **Note** | Fields in the registration form (see 2.1 Consumer Data Model): address, residenceType, size, ownership, #occupants, #pets, gardenArea, poolVolume, age, second, public, districtID, hhEducationLevel, hhIncomeRate, hhName |
Use Case 1.2: Visual Exploration Utility Data

<table>
<thead>
<tr>
<th>Use Case 1.2</th>
<th><strong>Visual Exploration Utility Data</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Goal in Context</strong></td>
<td>The consumer explores his water consumption visualizing his actions, his bills, tips, and alerts.</td>
</tr>
<tr>
<td><strong>Precondition</strong></td>
<td>The consumer is logged to the platform</td>
</tr>
<tr>
<td><strong>Success Condition</strong></td>
<td>The consumer is able to visualize his data</td>
</tr>
<tr>
<td><strong>Failed Condition</strong></td>
<td>--</td>
</tr>
<tr>
<td><strong>Primary actors</strong></td>
<td>Consumer, UtilityPortal</td>
</tr>
<tr>
<td><strong>Secondary Actors</strong></td>
<td>ESB, SmartH2ODB</td>
</tr>
<tr>
<td><strong>Steps</strong></td>
<td>- The customer requires to visualize the exploration page</td>
</tr>
<tr>
<td></td>
<td>- The Utility portal retrieves all the data and builds the page</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>--</td>
</tr>
</tbody>
</table>
3.4 Gamification Engine

The Gamification Engine is a component that listens to the actions of the Competitor consumer and of the Player and transforms them into a variety of rewards, for improving activity and participation.

The need for a Gamification approach in SmartH2O has been described in D2.1 Use cases and early requirements, by detailing the possible use case and motivations beyond this choice. In particular, the definition of points, achievements and rewards allow water utility companies to challenge their users with water saving goals to be achieved each month to obtain individual water consumption and household data provisioning. The users of the platform can be stimulated to adopt water saving behaviours by offering them gamified pricing schemes and water consumption data, to make them aware of the impact of their actions and the needs of the water utility company. The Gamification Engine is also used as a mean for raising water consumption awareness by promoting sustainable behaviours for families, friends and neighbours.
As shown in Figure 14, the **Gamification Engine** is the central component that handles the communication with the main SmartH2O platform components and takes care of registering users, converting users’ actions in other components into gamified actions for SmartH2O in order to compute scores, badges, achievements and other gamified features and being able to track and profile the users.

All the gamified data are stored in a **Gamification Engine DB**, in order to decouple the data from the various water utilities portals with the one managed by SmartH2O.

To extend the features of the water utility customer portal, a **Gamified Utility Portal UI**, tailored to the specific needs of the competitor users is created, in order to let the users of this group access their gamified profile, the points collected, the achievements obtained, and redeem the earned rewards.

The Gamification process has to be interactive and dynamically tailored to the rapid changes requested by the scenarios and the community at hand; for these reasons, new goals, rewards and achievement can be added in the platform by non-technical users through the **Gamification Engine Admin UI**.

With the same interface, but less privileges, admins can also monitor the status of the gamification campaign.

</tbody>
</table>
### Dependencies / Required Interfaces

The component requires the implementation of the following interfaces:

- **GET**/user(userid): returns all the metadata for the specified user
- **GET**/exists(userEmail): returns true if a user with the specified email exists, false otherwise
- **GET**/billByUser(userid): returns a short recap of the bill for the logged user
- **GET**/waterConsumptionStatisticsByUser(userid) returns the statistics of water consumption for the logged user
- **GET**/tips(userid): returns a list of tips for a specified user
- **GET**/waterUsageAlerts(userid): returns the list of usage alerts for the logged user
- **GET**/mediaContent(userID): videos, tutorial etc: may depend on the users
- **GET**/neighbors(userID): returns neighbors location (house holders only, same zip code)
- **POST**/signup: pushes a registration to the SmartH2O DB
- **POST**/userStatus (userID, online | offline): notify to the SmartH2O DB the change of status of a user
- **POST**/unsubscribe: remove a registration to the SmartH2O DB
- **POST**/selfOptIn
- **POST**/selfOptOut
- **POST**/familyOptIn
- **POST**/familyOptOut
- **POST**/geoOptIn
- **POST**/geoOptOut
- **POST**/addUserProfile: saves user profile information like: family members, house configuration, appliances etc.
- **POST**/updateUserProfile: updates user profile information like: family members, house configuration, appliances etc.
- **POST**/consumptionGoal(goal, userId): saves a consumption goal defined by the user
- **POST**/addConsumptionAction(userID, action): pushes a consumption action (e.g. "watering the garden for 15 minutes") to the SmartH2O DB

### 3.4.1 Main Use Cases

#### Use Case 2.1: Gamification Engine Signup

<table>
<thead>
<tr>
<th>Use Case 2.1</th>
<th>Gamification Engine Signup</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Goal in Context</strong></td>
<td>The consumer performs a registration to the platform, his data are saved into the SmartH2O DB.</td>
</tr>
<tr>
<td><strong>Precondition</strong></td>
<td>The consumer is logged with his customer account.</td>
</tr>
<tr>
<td><strong>Success Condition End</strong></td>
<td>The consumer becomes a Competitor customer and can exploit the gamification extension of the customer portal.</td>
</tr>
<tr>
<td><strong>Failed Condition End</strong></td>
<td>The consumer does not become a Competitor user, and cannot exploit the gamification extension of the customer portal.</td>
</tr>
<tr>
<td>Primary actors</td>
<td>Consumer, GamificationEngine</td>
</tr>
<tr>
<td>----------------</td>
<td>----------------------------</td>
</tr>
<tr>
<td>Secondary Actors</td>
<td>ESB, SmartH2ODB</td>
</tr>
</tbody>
</table>
| Steps | - the user requests the registration UI  
- the user fill and send the registration form  
- GamificationEngine adds the user to the competitor list  
- GamificationEngine forward the registration to the SmartH2ODB |
| Note | Fields in the registration form: photo (see Figure 4) |

![Sequence Diagram Use Case 2.1](image)

**Figure 15: Sequence Diagram Use Case 2.1.**

**Use Case 2.2: Visual Exploration Gamified Utility Data**

<table>
<thead>
<tr>
<th>Use Case 2.2</th>
<th>Visual Exploration Gamified Utility Data</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Goal in Context</strong></td>
<td>The competitor explores his water consumption visualizing his actions, his bills, his badges, the leaderboard etc.</td>
</tr>
<tr>
<td><strong>Precondition</strong></td>
<td>The competitor is logged to the platform</td>
</tr>
<tr>
<td><strong>Success Condition</strong> End</td>
<td>The competitor is explores his gamified data</td>
</tr>
<tr>
<td><strong>Failed Condition</strong> End</td>
<td>--</td>
</tr>
<tr>
<td><strong>Primary actors</strong></td>
<td>Competitor, GamificationEngine</td>
</tr>
<tr>
<td><strong>Secondary Actors</strong></td>
<td>ESB, SmartH2ODB</td>
</tr>
</tbody>
</table>
Steps

- The competitor requests to visualize his gamified water consumption page
- The GE Backend collects inputs from ESB (bill, alerts, consumption) and from its internal DB (points, actions, leaderboard)
- The GE Backend builds the page

Note

- This use case is specified for a competitor consumer, if the user is a simple consumer then the visualization will not include points and leaderboards.

Figure 16: Sequence diagram Use Case 2.2.

Use Case 2.3: Implementing Water Saving Action

<table>
<thead>
<tr>
<th>Use Case 2.3</th>
<th>Implementing Water Saving Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Goal in Context</td>
<td>The competitor submits a water saving action to the platform</td>
</tr>
<tr>
<td>Precondition</td>
<td>The competitor is logged to the platform</td>
</tr>
<tr>
<td>Success Condition</td>
<td>The water saving action is correctly saved into the SmartH2O DB</td>
</tr>
</tbody>
</table>
Failed Condition --

Primary actors Competitor, GamificationEngine

Secondary Actors ESB, SmartH2ODB

Steps
- The competitor submits a water saving action to the Gamification Engine
- The Gamification Engine add the points to the total points of the user
- The Gamification Engine notifies the ESB that the competitor has submitted a water saving action

Note
- The Gamification Engine will forward to the ESB only water saving actions, all the other actions (e.g. add a comment, read a tip) will be saved only locally to the GE DB.

Figure 17: Sequence Diagram Use Case 2.3.

Use Case 2.4: Inviting Family Member

<table>
<thead>
<tr>
<th>Use Case 2.4</th>
<th>Inviting Family Member</th>
</tr>
</thead>
<tbody>
<tr>
<td>Goal in Context</td>
<td>The HouseHolder invites another member of the family to join the platform</td>
</tr>
<tr>
<td>Precondition</td>
<td>The HouseHolder is logged to the platform</td>
</tr>
<tr>
<td>Success Condition End</td>
<td>The platform sends an invitation to the family member</td>
</tr>
<tr>
<td>Failed Condition End</td>
<td>The specified email does not exists, the HouseHolder is notified</td>
</tr>
<tr>
<td>Primary actors</td>
<td>HouseHolder, GamificationEngine</td>
</tr>
<tr>
<td>Secondary Actors</td>
<td>ESB, SmartH2ODB</td>
</tr>
</tbody>
</table>
Steps

- The HouseHolder requests the invitation page
- The HouseHolder fills the registration page specifying the other member role and email
- The GamificationEngine sends a notification to the ESB with the new role and email
- The ESB saves the new member in the SmartH2ODB and sends an invitation via email to the new member

Note

Figure 18: Sequence diagram Use Case 2.4.

Use Case 2.5: Setting action types

<table>
<thead>
<tr>
<th>Use Case 2.5</th>
<th>Setting action types</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Goal in Context</strong></td>
<td>The GE Content and Rules Editor configures a new type of action</td>
</tr>
<tr>
<td><strong>Precondition</strong></td>
<td>The GE Content and Rules Editor is logged to the platform, a Gamified application exists.</td>
</tr>
<tr>
<td><strong>Success Condition</strong></td>
<td>A new action type or reward type is inserted into the system</td>
</tr>
<tr>
<td><strong>Failed Condition</strong></td>
<td>No action type or reward type is inserted into the system</td>
</tr>
<tr>
<td><strong>Primary actors</strong></td>
<td>GE Content and Rules Editor, GamificationEngine</td>
</tr>
<tr>
<td><strong>Secondary Actors</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Steps</strong></td>
<td>- The GE Content and Rules Editor submits a configuration for a new action (including: name, score, participation, reputation, repeatable, timeElapsed, active)</td>
</tr>
<tr>
<td></td>
<td>- The Gamification Engine saves the action</td>
</tr>
</tbody>
</table>
3.4.2 Component Interfaces Specification

Retrieve the list of available Actions

In order to get available actions for a specific gamified application the Get Action web service is available. The service requires the name of the gamified application as a mandatory parameter.

The endpoint is:

{webappUrl}/UserActivityCreditWebServiceREST/GetActions/getActions.do

A sample of JSON response is:

```json
{
  "actions": [
    {
      "gamifiedApplication": "Energy Portal",
      "actionName": "Do energy saver quiz",
      "actionID": 4
    },
    {
      "gamifiedApplication": "Energy Portal",
      "actionName": "Login",
      "actionID": 1
    }
  ]
}
```

Get the user credits

In order to get the user credits obtained by interacting with the game, it is required to specify the user email as parameter of the REST web service.

Endpoint
Get the rewards

To get the rewards that can be redeemed by the user, it is also required to specify the user email as a parameter of the web service.

Endpoint

{webappUrl}/UserActivityCreditWebServiceREST/GetUserRewards/getUserRewards.do?userEmail= xxx@yyy.com

Response

```json
{
    "rewards": [
        {
            "rewardName": "CouponDiscount",
            "rewardID": 1,
            "neededPoints": 1000,
            "userEmail": "xxx@yyy.com"
        }
    ]
}
```

Post a new rewards

To post a new reward that can be redeemed by the user, it is also required to specify the user email as a parameter of the web service.

In order to register a new reward in the gamification platform, the Post a new reward web service is available. The request is a JSON array with the following parameters:

- **RewardName** [MANDATORY]
- **neededPoints** [MANDATORY]

Endpoint

{webappUrl}/UserActivityCreditWebServiceREST/PostUserRewards/postUserRewards.do

Assign Actions To User
In order to register the user action in the gamification platform, the **Assign Actions To User** web service is available. The request is a JSON array with the following parameters:

- **email**: the email of the user to assign the action [MANDATORY]
- **time**: the timestamp of the request in Unix Timestamp format [MANDATORY]
- **area**: the name of the gamified application [MANDATORY]
- **name**: the name of the action [MANDATORY]
- **description**: the description of the action [MANDATORY]
- **tag**: additional parameter for managing non-repeatable action [NOT MANDATORY]
- **link**: additional parameter for managing non-repeatable action [NOT MANDATORY]
- **executor**: additional parameter for managing non-repeatable action [NOT MANDATORY]
- **objectkey**: additional parameter for managing non-repeatable action [NOT MANDATORY]

**Input**

```
[{
  "email": "xxx@yyy.com",
  "time": 1407307785347,
  "area": "Energy Portal",
  "name": "Login",
  "description": "Login",
  "tag": "",
  "link": "",
  "executor": ""
}]
```

**Endpoint**

```
{webappUrl}/UserActivityCreditWebServiceREST/AssignActionsToUsers/assignActionsToUsers.do
```

### Redeem User Reward

In order to register the user reward in the gamification platform the **Redeem User Reward** we service is available. The request is a JSON array with the following parameters:

- **idReward**: the id of the reward to redeem [MANDATORY]
- **userEmail**: the email of the user that redeems the reward [MANDATORY]

**Input**

```
{"idReward": 1,"userEmail": "xxx@yyy.com "}
```

**Endpoint**

```
{webappUrl}/UserActivityCreditWebServiceREST/RedeemUserReward/redeemUserReward.do
```

### User Registration

To push user registration data about a new user in the Gamification Engine the **User Registration** web service will be used. The request is a JSON array with the following parameters:
• birthdate: the birthdate of the user in UNIX timestamp format
• username
• password
• email
• firstname
• lastname
• city
• country
• publicprofile: boolean value to indicate if the user is active or not in the community
• internal: boolean value to indicate if the user is an internal user of the community
• isocode: language isocode (used to manage international community)
• geoarea
• photoname: the name of the photo of the user
• photocode: the photo of the user in Base64 format

Input

```json
[{"birthdate":1407276000000,"username":"markross","password":"markross","email":"mark.ross@e e.com","firstname":"Mark","lastname":"Ross","city":"London ","country":"United Kingdom","publicprofile":true,"internal":false,"isocode":"en","geoarea":"Europe"}]
```

Endpoint

```
{webappUrl}/UserRegistrationWebServiceREST/UserRegistration/userRegistration.do
```

**User update**

To push the update user data to the gamification platform the **User update web service will be used**.

The JSON array for the request is composed by the following parameters:
- birthdate: the birthdate of the user in UNIX timestamp format
- username
- password
- email [MANDATORY]
- firstname
- lastname
- city
- country
- publicprofile: boolean value to indicate if the user is active or not in the community
- internal: boolean value to indicate if the user is an internal user of the community
- isocode: language isocode (used to manage international community)
- geoarea
- photoname: the name of the photo of the user
- photocode: the photo of the user in Base64 format

Input

```json
[{"birthdate":1407276000000,"username":"markross","password":"markross","email":"mark.ross@e e.com","firstname":"Mark","lastname":"Ross","city":"London ","country":"United Kingdom","publicprofile":true,"internal":false,"isocode":"en","geoarea":"Europe"}]
```

Endpoint

```
{webappUrl}/UserRegistrationWebServiceREST/UserUpdate/userUpdate.do
```
3.5 Games Platform

As explained in D4.1, First social game and implicit user information techniques, the introduction of a platform for handling Games in the SmartH2O project derives from the need of being able to attract the interests of users which are not strictly linked with water utilities while being able to run even as a standalone component. Different game design approaches and instantiations are being investigated; nonetheless, they should all rely on an infrastructure that provides features and data collection common to all of them.

This is the role of the Games Platform, a central component illustrated in Figure 20, which handles the communication with the main SmartH2O platform and takes care of managing users’ registration, profiling them, orchestrating and keeping track of game instances and the gameplay sessions of the players. The points and the achievement collected in the digital games should be transferred towards the Gamification Engine, to create a tied link between the two approaches for engaging the users. For these reasons, a dedicated database takes care of storing the users and their details, gameplay session’s data, point and achievements obtained within the games platform.

![Game Platform component diagram](image)

**Figure 20: The Game Platform component diagram.**

At the time of writing, the component should support two different game instances: a Quiz Game, called Drop!TheQuestion, that is the digital extension of the Drop! board game and is used to collect behavioural data from the users; a single player game, called DropOn! that is used to promote sustainable behaviours and as an educational game. Both of them are described in D4.1. For the definition of new content for the proposed games (e.g. badges and achievements for the single player mode), the games platform offers also a Content editor UI that allows non-technical users to enrich the content offered by the applications without the need of modifying the underlying architecture or create new builds.
Component Name | Games Platform
---|---
**Leader** | MOONSUB
**Partners** | POLIMI
**Goal** | The component manages the integration with all the games and it talks with the GamificationEngine to save actions and points

### User use cases

<table>
<thead>
<tr>
<th>Use case</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.1 Use case: Games Platform signup</td>
<td></td>
</tr>
<tr>
<td>11.2 Use case: Playing a standard mobile game</td>
<td></td>
</tr>
<tr>
<td>11.3 Use case: Playing the card game and its digital game extension</td>
<td></td>
</tr>
<tr>
<td>11.4 Use case: Gaining power-ups based on the Gamification Engine credits</td>
<td></td>
</tr>
<tr>
<td>11.5 Use case: Connecting player profile to the Gamification Engine</td>
<td></td>
</tr>
<tr>
<td>11.6 Use case: Setting content of game questions</td>
<td></td>
</tr>
<tr>
<td>11.7 Use case: Setting content of questions for a given utility game</td>
<td></td>
</tr>
</tbody>
</table>

### Provided Interfaces

This component is a mobile application written using the framework Unity.

### Dependencies / Required Interfaces

The component requires the implementation of the following interfaces:

- **[GET]**: GetUserRewards
- **[POST]**: signup: pushes a registration to the SmartH2O DB
- **[POST]**: RedeemUserReward
- **[POST]**: UserStatus (userId, online | offline): notify to the SmartH2O DB the change of status of a user
- **[POST]**: Unsubscribe: removes a registration from the SmartH2O DB
- **[POST]**: AddUserProfile: saves user profile information like: family members, house configuration, appliances etc..
- **[POST]**: UpdateUserProfile: updates user profile information like: family members, house configuration, appliances etc..
- **[POST]**: ConnectGEProfile: connect the gamer profile to the associated GE profile
- **[POST]**: AssignActionsToUsers(userid, action): forwards an action to the GamificationEngine

### 3.5.1 Main Use Cases

#### Use Case 3.1: Application Registration

<table>
<thead>
<tr>
<th>Use Case 3.1</th>
<th>Application Registration</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Goal in Context</strong></td>
<td>The player registers the installed application into the Games Portal</td>
</tr>
<tr>
<td><strong>Precondition</strong></td>
<td>The player installed the application on a device</td>
</tr>
<tr>
<td><strong>Success End Condition</strong></td>
<td>The player is correctly registered into the Games Portal</td>
</tr>
</tbody>
</table>
Failed Condition End | The email already exists, the player is notified

Primary actors | Player, GamesManager

Secondary Actors | ESB, Authentication Gateway

Steps
- The player asks to register to the platform specifying email and name
- The Games Manager verifies if the email has been used on another registration invoking the Authentication Gateway
- If the email does not exist then the Games Manager invokes the Authentication Gateway to save the new user
- Otherwise it notifies the error to the player

Note

Figure 21: Sequence Diagram Use Case 3.1.

Use Case 3.2: Game Results

<table>
<thead>
<tr>
<th>Use Case 3.2</th>
<th>Game Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Goal in Context</td>
<td>The player ends a game and the platform forwards the results to the GamificationEngine</td>
</tr>
<tr>
<td>Precondition</td>
<td>The player is logged to the platform, the player played one of the games in the platform</td>
</tr>
<tr>
<td>Success Condition End</td>
<td>The gamer gains points on the GamificationEngine</td>
</tr>
<tr>
<td>Failed Condition End</td>
<td>--</td>
</tr>
</tbody>
</table>
Primary actors

| Player, GamesPlatform |

Secondary Actors

| ESB, GamificationEngine |

Steps

- The gamer ends a game
- The game calculates the results and send it to the ESB
- The ESB forwards the result to the GamificationEngine

Note

Figure 22: Sequence Diagram Use Case 3.2

Use Case 3.3: Submit a new Question

| Use Case 3.3 | Submit a new Question |

Goal in Context

Add a new Question to the set of questions used in the Drop quiz game

Precondition

--

Success Condition

End

The new question is saved and available for next games

Failed Condition

End

--

Primary actors

Games Platform CE, GamesPlatform

Secondary Actors

--

Steps

- The Games Platform CE accesses the Games Platform CE UI and submits a new Question and a set of Answers (including the correct one)
- The Games Platform saves the question into the DB

Note

The list of fields for Question and Answer are specified in 2.3
3.6 Enterprise Service Bus (ESB)

This component is a service oriented middleware layer that supports the loose coupling of the SmartH2O components; it permits the publication of their interfaces (Application Programming Interfaces, APIs) and the synchronous and asynchronous communication among components. The goal of the ESB is to decouple the heterogeneous components of the SmartH2O platform as much as possible, to support the extension with new services and functions and the rapid adaptation of the platform to new contexts (e.g., other utility companies with different IT standards and information systems).

Figure 22: Enterprise Service Bus component diagram.

Figure 23: Sequence Diagram Use Case 3.3
Table 1 summarizes Use Cases where the ESB component is involved. Provided interfaces and interfaces to be implemented (Required interfaces) are detailed for each use case. This summary will allow identification of common requirements among components and will be the basis in defining the minimum required set of interfaces to be provided and implemented interfaces.

3.6.1 Component Interfaces Specification

3.7 Smart Meter Data Manager

The Smart Meter Data Management component (from now on, SMDM) has the role to acquire, process and consolidate water consumption data automatically provided by smart meters. The sources of the water consumption metering data are the hardware systems and the software platforms of the water utility. The data is provided by FTP/SFTP as bulk files (CSV, XML) containing periodical measurements on hourly, daily, weekly, monthly, etc. bases.

The increased frequency of the water counter acquisition and processing is a key factor in delivering accurate data for assisting on correct decision making. As a consequence, the SMDM component has to provide a scalable method for processing and consolidating increasing amounts of consumption data flowing from an increasing number of water counters. In this sense, the critical business requirement for the SMDM component is to implement a scalable architecture beyond traditional RDBMSs. This is accomplished by implementing specific BigData processing techniques such as parallel processing, incremental MapReduce computations, virtualization of the storage for using cloud computation in order to achieve data consolidation while obtaining a reduced response time.
Component Name | Smart Meter Data Manager
---|---
**Leader** | SETMOB
**Partners** | --
**Goal** | Collecting consumption data via smart meters
**User use cases** | 8.2 Collecting consumption data

**Provided Interfaces** | This component is a batch process performing an extract, transform, load (ETL) suite of jobs for pulling the water consumption data from data files and consolidating in the SmartH2O platform database.

**Dependencies / Required Interfaces** | The component requires the implementation of the following jobs:
- FileValidation: checks if the file fulfills the label and size related criteria
- StructureValidation: checks if the data file has the structure previously agreed with the water utility
- DataProcessing: launching the extraction process, preparing the record set for persistence, loading the record set to the database

### 3.7.1 Main Use Cases

**Use Case 5.2: Collecting consumption data**

<table>
<thead>
<tr>
<th>Use Case 5.2</th>
<th>Collecting consumption data</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Goal in Context</strong></td>
<td>Collecting consumption data via smart meters</td>
</tr>
<tr>
<td><strong>Precondition</strong></td>
<td>Water consumption of customer household is metered (smart meters) for the reference interval of time</td>
</tr>
<tr>
<td><strong>Success Condition End</strong></td>
<td>The system stores in the SmartH2O platform database the consumption data for a reference interval of time</td>
</tr>
<tr>
<td><strong>Failed Condition End</strong></td>
<td>The system is not able to store in the SmartH2O platform database the consumption data for a reference interval of time despite the process has been correctly initiated by the water utility</td>
</tr>
<tr>
<td><strong>Primary actors</strong></td>
<td>Smart Meter Data Manager</td>
</tr>
<tr>
<td><strong>Secondary Actors</strong></td>
<td>SmartMetered user, smart meter</td>
</tr>
</tbody>
</table>
Steps

- The smart water meter measures the customer’s water consumption. The consumption data is collected by the water utility automatically (smart meter). The water utility creates a file with water consumption data in a pre-agreed format.
- The water consumption data is transmitted to the SmartH2O platform where it is received, validated, processed and stored.
- The result of processing the collected consumption data by the SmartH2O platform is saved in a Log file that can be visualised online by the water utility or by the platform administrators.

Note

This use case is triggered by the water utility uploading to the SmartH2O server via SFTP the file containing the consumption data for a reference interval of time.

3.8 Portal Data Exchange Manager

This component deals with the data exchange communication that occurs “behind the scenes” between the SmartH2O platform and the third party applications already supporting the interaction with the various types of users.

There are several use cases of data exchange implemented by this component:

- Transfer of user authentication. Single Sign-On, both for Consumer Users and Admin Users. Partner portals must be first registered for trust relationship.
- Transfer of user profile. This flow transfers user profile from a source portal to a destination portal. As an internal rule, each portal might transfer user profile only if user previously agreed on such a transfer.

To ensure a smooth and complete transfer of user profile, it is recommended that each Water utility portal implement a standard of user profile. Else, a mapping of user attributes between different portals must be implemented by this component.

Component Name | Portal Data Exchange Manager
**Leader**  
SETMOB

**Partners**  
--

**Goal**  
Manages transfer of information between SmartH2O and similar portals of Water Utility

**User use cases**
- 6.1 Transfer of incoming user authentication
- 6.2 Transfer of outgoing user authentication
- 6.3 Transfer of user profile incoming
- 6.4 Transfer of user profile outgoing

**Provided Interfaces**
- [GET] authenticateIncomingUser(portalId, partnerPortalKey, userId). Authenticate incoming user against SmartH2O platform and provide authentication token to partner portal
- [GET] getUserProfile(portalId, partnerPortalKey, authenticationKey, userId). Returns SmartH2O user profile

**Dependencies / Required Interfaces**
We assume that the Partner portal will implement following interface:
- [GET] authenticateIncomingUser(portalId, smartH2OKey, userId). Expected to retrieve authentication token from partner portal
- [GET] getUserProfile(portalId, smartH2OKey, authenticationKey, userId). Returns Partner portal user profile

### 3.8.1 Main Use Cases

**Use Case 6.1: Transfer of incoming user authentication**

<table>
<thead>
<tr>
<th>Use Case 6.1</th>
<th>Transfer of incoming user authentication</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Goal in Context</strong></td>
<td>Provide Single Sign-On service for incoming users from registered portals</td>
</tr>
<tr>
<td><strong>Precondition</strong></td>
<td>Partner portal was previously registered in SmartH2O</td>
</tr>
<tr>
<td><strong>Success Condition</strong></td>
<td>If existing and active user in SmartH2O, incoming user is authenticated</td>
</tr>
<tr>
<td></td>
<td>If user not exist in SmartH2O, incoming user is not authenticated</td>
</tr>
<tr>
<td><strong>Failed Condition</strong></td>
<td>Existing active user is not authenticated</td>
</tr>
<tr>
<td><strong>Primary actors</strong></td>
<td>PartnerPortal, Portal Exchange Manager</td>
</tr>
<tr>
<td><strong>Secondary Actors</strong></td>
<td>ESB, AuthenticationGateway</td>
</tr>
<tr>
<td><strong>Steps</strong></td>
<td>Partner portal send an authentication request for its user</td>
</tr>
<tr>
<td></td>
<td>Partner Portal Exchange Manager check user against AuthenticationGateway</td>
</tr>
<tr>
<td></td>
<td>If User exists and is active, authentication key for user is returned.</td>
</tr>
<tr>
<td></td>
<td>If User does exist or is not active, an notice message is returned</td>
</tr>
</tbody>
</table>
Use Case 6.2: Transfer of outgoing user authentication

<table>
<thead>
<tr>
<th>Use Case 6.2</th>
<th>Transfer of outgoing user authentication</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Goal in Context</strong></td>
<td>Provide Single Sign-On service for outgoing users of SmartH2O</td>
</tr>
<tr>
<td><strong>Precondition</strong></td>
<td>Partner portal was previously registered in SmartH2O</td>
</tr>
</tbody>
</table>
| **Success Condition** | If existing and active user in PartnerPortal, outgoing user is authenticated  
If user does not exist in PartnerPortal, outgoing user is not authenticated |
| **Failed Condition**  | Existing active user is not authenticated in PartnerPortal |
| **Primary actors**    | Portal Exchange Manager |
| **Secondary Actors**  | ESB, AuthenticationGateway |
**Steps**

- AuthenticationGateway sends an authentication request a user against a PartnerPortal
- Partner Portal Exchange Manager verifies user against PartnerPortal
- If User exists and is active in PartnerPortal, authentication key for user is returned.
- If User does exist or is not active in PartnerPortal, an notice message is returned

**Note**

Figure 26: Sequence Diagram Use Case 6.2.

**Use Case 6.3: Transfer of user profile – incoming**

<table>
<thead>
<tr>
<th>Use Case 6.3</th>
<th>Transfer of user profile - incoming</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Goal in Context</strong></td>
<td>Transfer of user profile from partner portal to SmartH2O DB</td>
</tr>
<tr>
<td><strong>Precondition</strong></td>
<td>Partner portal was previously registered in SmartH2O. Mapping of user profiles was previously configured in SmartH2O</td>

</tr>
</tbody>
</table>
| Steps               | - Partner Exchange Manager sends request for user profile to partner portal  
|                     | - Partner Portal sends user profile    
|                     | - Partner Exchange Manager saves user profile in SmartH2O database  |
| Note                | Figure 27: Sequence Diagram Use Case 6.3. |
|                     | Use Case 6.4: Transfer of user profile – outgoing |
| Use Case 6.4        | Transfer of user profile - outgoing    |
| Goal in Context     | Transfer of user profile from SmartH2O to partner portal  |
| Precondition        | Partner portal was previously registered in SmartH2O  |
| Success Condition   | Outgoing user profile is saved to partner portal database  |
| Failed Condition    | Outgoing user profile is not saved to database  |
| Primary actors      | PartnerPortal, Portal Exchange Manager  |
| Secondary Actors    | ESB, SmartH2O DB                       |
### Steps

- PartnerPortal sends a profile transfer request to Portal Exchange Manager
- Portal Exchange Manager retrieves user profile from SmartH2O
- Portal Exchange Manager sends user profile to Partner Portal
- Partner Portal saves user profile to its database

### Note

Figure 28: Sequence Diagram Use Case 6.4.

### 3.8.2 Component Interfaces Specification

**[GET] authenticatIncomingUser(portalId, partnerPortalKey, userId).**

Authenticate incoming user against SmartH2O platform and provide authentication token to partner portal.

Parameters:

- portalId. ID of portal that requests authentication. Portal must be enlisted as Partner Portal in SmartH2O DB
- partnerPortalKey. Key / token. Identification key / token that ensures identity of client application. This key / token must be exist in Partner Portal record in SmartH2O DB and must be provided to Partner Portal for requests against SmartH2O components
- userId. Id of user that requests authentication

The endpoint is:

```
{webappUrl}/PortalExchangeManagerWebServiceREST/authenticateIncomingUser/authenticateIncomingUser.do
```
[GET] getUserProfile(portalId, partnerPortalKey, authenticationKey, userId) Returns SmartH2O user profile

A sample of JSON response for a successful authentication is:

```json
{
    "authResult": {
        "authKey": "FFD321324.m432dssadeqwiopi432",
        "authenticated": "Yes"
    }
}
```

A sample JSON response for a failed authentication is:

```json
{
    "authResult": {
        "authenticated": "No",
        "reason": "user does not exist"
    }
}
```

[GET] getUserProfile(portalId, partnerPortalKey, authenticationKey, userId)
Returns SmartH2O user profile

Parameters:
- portalId. ID of portal that requests authentication. Portal must be enlisted as Partner Portal in SmartH2O DB
- partnerPortalKey. Key / token. Identification key / token that ensures identity of client/application. This key / token must be exist in Partner Portal record in SmartH2O DB and must be provided to Partner Portal for requests against SmartH2O components
- userId. Id of user whose profile need to be retrieved

The endpoint is:
```
{webappUrl}/PortalExchangeManagetWebServiceREST/getUserProfile/getUserProfile.do
```

A sample of JSON response for a successful retrieval of user profile is:

```json
{
    "userId":1220211102,
    "sourceSystem":"SmartH2O",
    "result": {
        "status":"Ok",
        "reason":"success"
    },
    "profileData": {
```
A sample of JSON response for a failed retrieval of user profile is:

```json
{
  "userId":1220211102,
  "sourceSystem":"SmartH2O",
  "result":{
    "status":"nOk",
    "reason":"error message"
  }
}
```

### 3.9 Water Utility Admin Portal

Figure 29 shows the essential component diagram of the Water Utility Admin Portal.

![Figure 29: Water Utility Admin Portal Component Diagram.](image)

The portal offers services to the Consumption Supervisor and the Consumer Portal Content Editor, both administrative users of the water utility company. It is organised in three main sub-components: a Consumption Monitor, which allows the Consumption Supervisor to check the consumption data of specific consumers; the Customer Consumption simulator, which allows the Consumption Supervisor to run simulation based on specific simulated incentive campaigns and on the services offered by the Agent-Based Modelling component; and the Utility content editor Portal, which permits the Content Editor to provide content for feeding the Consumer Portal.
<table>

|                | 7.7 Create content (news, tips for water consumption optimization, …) |
| Provided Interfaces | This component is a web application, which integrates inputs from external sources. |
| Dependencies / Required Interfaces | The component requires the implementation of the following interfaces:  
|                | - [GET]getGeoLocations(): retrieves all geolocation divisions of Water Utility  
|                | - [GET]getUserAttributes(): retrieves all user attributes available for consumers of Water Utility  
|                | - [GET]getSegments(): retrieves all consumer segments, already defined for a Water Utility  
|                | - [GET]getWaterConsumption(geoLocations, segments, period): retrieves actual water consumption data for specified geolocations, segments, for a specified period for a Water Utility.  
|                | - [GET]getWaterConsumptionSimulationPastInfo(geoLocations, segments, period): retrieves simulation of user consumption based on past consumption info.  
|                | - [GET]getWaterConsumptionSimulationIncentive(geoLocations, segments, period, incentive): retrieves simulation of user consumption based on incentive/reward.  
|                | - [GET]getWaterConsumptionSimulationPricing(geoLocations, segments, period, pricingScheme): retrieves simulation of user consumption based on pricing scheme.  
|                | - [GET]getActionRewards(segment): retrieves existing game actions and associated rewards for specified consumer segment  
|                | - [GET]getSimulationIncentiveRewards(): retrieves existing incentive/rewards that were implemented by consumption simulation engines (ABM)  
|                | - [GET]getSimulationPricingSchemes(): retrieves a list existing pricing schemes that were implemented by the consumption simulation engines (ABM)  
|                | - [POST]saveSegment(userAttributes): creates or updates a segment based on a collection of user attributes for Water Utility  
|                | - [POST]saveActionRewards(segments, actions, reward): creates game actions and associated reward for specified consumer segments |
### 3.9.1 Main Use Cases

<table>
<thead>
<tr>
<th>Use Case 7.1</th>
<th><strong>Visualizing aggregate household consumption information by geo-location</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Goal in Context</strong></td>
<td>Identifying e.g. leakage or consumption metrics of customers to take appropriate action (e.g. adjust pumping, fix leaks, adapt pricing schemes)</td>
</tr>
<tr>
<td><strong>Precondition</strong></td>
<td>Customer households are metered; Household consumption data is available</td>
</tr>
<tr>
<td><strong>Success End Condition</strong></td>
<td>Household consumption data is visualized.</td>
</tr>
<tr>
<td><strong>Failed End Condition</strong></td>
<td>Household consumption data is not visualized.</td>
</tr>
<tr>
<td><strong>Primary actors</strong></td>
<td>ConsumptionSupervisor</td>
</tr>
<tr>
<td><strong>Secondary Actors</strong></td>
<td>ESB, SmartH2ODB</td>
</tr>
</tbody>
</table>
| **Steps** | - User selects specific geographic region / district / household  
  - The system visualizes the aggregated metered water consumption data of a specific geographic region / district / household  
  - The user can interact with the visualization by choosing different zoom levels of the information (hourly, daily, monthly)  
  - The user can compare average to a set of available other aggregate averages (e.g. municipality, district)  
  - If data available, the user can compare the consumption with amount of pumped water to identify potential leakages |

**Note**
Use Case 7.2  Identifying customer segments

<table>
<thead>
<tr>
<th><strong>Goal in Context</strong></th>

<td><strong>Primary actors</strong></td>
<td>Consumption Supervisor</td>
</tr>
<tr>
<td><strong>Secondary Actors</strong></td>
<td>ESB, SmartH2ODB, Gamification Engine</td>
</tr>
</tbody>
</table>
| **Steps**             | User selects segment  
                       | User defines reward/incentive  
                       | User selects actions to be performed to get the reward/incentive  
                       | User saves the actions and rewards for specified segment |
| **Note**              |
Use Case 7.4  
Predicting customer segment consumption behavior on past information

**Goal in Context**  
*Water consumption prediction by customer segment based on past information and customer segment defined from information available from the app.*

**Precondition**  
Customer households have provided household and consumption information. Households were metered.

**Success End Condition**  
*The model is able to accurately predict customer segment consumption behaviour.*

**Failed Condition**  
*The model is not able to accurately predict customer segment consumption behaviour.*

**Primary actors**  
Consumption Supervisor

**Secondary Actors**  
ESB, ABM, SmartH2OBD

**Steps**  
*Users selects simulation type= based on past information  
User selects segment, and future simulation period  
Based on behaviour model, system predicts future consumption behaviour based on past information*
**Use Case 7.5**

Predicting customer segment consumption behavior on incentive response

**Goal in Context**

*Prediction of customer water consumption response to specific reward / incentive scheme based on the estimated model of customer response to rewards/incentive schemes.*

**Precondition**

Customer households have provided household and consumption information. Households were metered. Relevant and feasible rewards have been identified. Customer response model has been estimated.

**Success End Condition**

The model is able to accurately predict customer consumption response to reward/incentive scheme.

**Failed End Condition**

The model is not able to accurately predict customer consumption response to reward/incentive scheme.

**Primary actors**

Consumption Supervisor

**Secondary Actors**

ESB, Gamification Engine, ABM

**Steps**

- Users selects simulation type = based on reward/incentive
- User selects segment, and future simulation period
- User selects reward/incentive used for simulation
- Based on behaviour model, system predicts future consumption behaviour based on reward/incentive response

**Note**

</table>
3.10 Authentication Gateway

This component role is to centralize and consolidate the user registration data within the SmartH2O platform database, also for the users registered in the external components, which may use their own local user databases. The involved components are:

- Water Utility Customer Portal
- Gamification Engine
- Games Portal
- Water Utility Admin Portal

Also, this component provides a unique point for authentication to all the users primarily registered at a component level, in order to login to other components by using the original set of credentials without the need to perform another registration.
Figure 36: Authentication Gateway component diagram.

<table>
<thead>
<tr>
<th>Component Name</th>
<th>Authentication Gateway</th>
</tr>
</thead>
<tbody>
<tr>
<td>Leader</td>
<td>SETMOB</td>
</tr>
<tr>
<td>Partners</td>
<td>POLIMI</td>
</tr>
<tr>
<td>Goals</td>
<td>Consolidates the user registration data within the SmartH2O platform database. Provides a unique point for authentication to all the users primarily registered at a component level, in order to login to other components.</td>
</tr>
</tbody>
</table>
| User use cases | - Consolidates the user registration in the SmartH2O platform database  
- User authentication through Single Sign-On |
| Provided Interfaces | - [POST]signUpToSmartH2ODB(userAttributes): creates a user registration to the SmartH2O DB  
- [POST]unsubscribeFromSmartH2ODB: remove a registration from the SmartH2O DB  
- [POST]updateUserProfileToSmartH2ODB: updates user profile information like: family members, house configuration, appliances etc.. to the SmartH2O DB |
| Dependencies / Required Interfaces | The component requires the implementation of the following interfaces:  
- [POST]delegateAuthentication: authenticates the user who is passing the credentials  
- [POST]delegationSignOff: signs off the user authenticated through Single Sign On |

3.10.1 Main Use Cases

Use Case 8.1: Consolidates the user registration in the SmartH2O platform database
### Use Case 8.1: Consolidates the user registration in the SmartH2O platform database

**Goal in Context**
Register in the central database the user that has been previously registered in a component databases

**Precondition**
The user has performed registration in a component database

**Success Condition End**
The user is registered in the SmartH2O central database

**Failed Condition End**
The component is not able to register the user in the SmartH2O central database

**Primary actors**
SmartH2O User Registration

**Secondary Actors**
ESB, SmartH2ODB

**Steps**
- The user performs registration in any component managing its own user database
- The component calls the SmartH2O User Registration
- The user is registered in the SmartH2O database

**Note**
This use case is triggered by any of the components performing their own user registration:
- Water Utility Customer Portal
- Gamification Engine
- Games Portal
- Water Utility Admin Portal

---

**Figure 37: Sequence diagram for Use Case 8.1.**

---

**Use Case 8.2: User authentication through Single Sign-On**

---

**Use Case 8.2**
User authentication through Single Sign-On
<table>
<thead>
<tr>
<th><strong>Goal in Context</strong></th>
<th>Allow an user authenticated in a component to access another component where he has not directly performed registered through a Single Sign-on mechanism</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Precondition</strong></td>
<td>The is registered in the SmartH2O platform database</td>
</tr>
<tr>
<td><strong>Success Condition</strong></td>
<td>The user access a component where he has not directly performed registration</td>
</tr>
<tr>

### 3.11 Pricing Engine, Agent Based Modelling and Models of User Behaviour

This section overviews the current understanding of the role and internal structure of the Pricing Engine, Agent Based Modelling and Models of User Behaviour. The present specification will be further detailed and refined as part of the technical progress of the work in WP3 User Modelling, WP4 Saving water by social awareness, WP5 Saving water by dynamic pricing.

The **Pricing Engine** offers services to both the Customer and the Consumption Supervisor, who access it through dedicated user-interfaces. The Pricing Engine Backend manages the dialogue of the two above mentioned user groups with the price modelling and simulation.
functionality offered by the Pricing Modelling Services. The resulting coarse organization of the component is overviewed in Figure 39.

The Agent Based Modelling component allows the water utility to simulate whole districts of users, thus extrapolating user models at a larger scale. The agent based model includes influence/mimicking mechanisms and social interaction among the consumers, and thus will be employed by the water utility to understand how some user types (leaders/influencers) can stimulate a behavioural change on other users.

It exploits the Models of User Behaviour component embodies models describing water consumption behaviour of a single customer or a class of consumers. It internal coarse organization is shown in Figure 40.

Through this component, the water utility can visualize the water consumption of each customer at a fixture/appliance level, in order to identify consumption patterns and trends, and thus identifying the most promising areas where conservation efforts may be polarized. Furthermore, based on their behaviour, consumers are clustered into different classes, and the water utility can foresee the consumer behaviour in front of exogenous variables (climate), social awareness campaigns, social pressure, water restrictions, etc. For a description of the algorithms exploited to model the user behaviour, see deliverable D3.2: First user behaviour models.
4. Deployment Architecture

As detailed in the component architecture diagram, SmartH2O Platform is a heterogeneous collection of components with different functionality that interact to each other to deliver the proposed objectives. Each component by itself deliver a certain functionality but it also requires general platform services like authentication, communication or data services. Components also need data or computation from other component of the platform.

The major technical criterion for the selection of the platform architecture was to have a Service Oriented Architecture (SOA). This requirement will ensure loose coupling and isolation of logic of components. Being a current industry standard, SOA architecture will also allow easy integration of Smart H2O platform with other existing platforms. SOA architecture can also provide scalability, security and availability of the platform.

SOA architecture imposed that interaction between components and interaction between components and the platform must be realized via an integration middleware component. The most suitable integration component for SOA architecture was an Enterprise Service Bus (ESB) component. This architecture pattern will also allow easy but solid integration of Water Utility existing systems with SmartH2O Platform. For example an existing CRM system of Water Utility can be easily plugged in to provide segmentation information of customers.

**Figure 41- General integration platform architecture**

SOA architecture will be implemented using open and standardized technologies and frameworks like REST, HTTP(S), J2EE (Java Enterprise Edition), JBoss Fuse. Each component will be also internally implemented by open source frameworks and languages, industry proven technologies but in the context of the SmartH2O platform they will expose a common interface of Web Services so that they can be integrated in the platform with the rest of the components.

Most components contain an internal multi-tiered architecture relying on web-based J2EE framework. That means that the client application will typically run in a web browser.
Technical Implementation details of each component can be found in ANNEX2 - List of technologies, frameworks and languages used.

![Multi-tiered Architecture Diagram](image)

**Figure 42 - Component level multi-tiered architecture (from docs.oracle.com)**

The choice of multi-tiered architecture will provide:
- scalability of Business Logic and Data tiers
- no client-side maintenance
- separation of development roles. User Interface development tasks are separated from Business Logic development tasks. Development task separation allow specialization and scalability of development resources

In the context of Water Utility oriented applications this choice of architecture and technologies will deliver, among many other, these main benefits:
- **interoperability**. Easy and rapid adaptation of SmartH2O platform to customer specifics. Each Water Utility provider is supposed to operate more management systems that can be integrated in the Platform to provide enhanced Customer and Water Usage data. Also they can be fed by Smart H2O with behavioural data and consumption scenarios.
- **scalability**. Water Utility companies may handle huge amounts of data. Distribution of computing, data access and storage and presentation operations allow efficient resources allocation in such quantity that the Platform delivers required performance level.
4.1 Development Environment Deployment

The hardware infrastructure of the development and testing server is powered by a Dell PowerEdge 6850 with 4 Intel Xeon dual core CPUs at 3.2 GHz, 32GB of DDR2 ECC RAM and 1.5 TB of RAID storage. These resources are split by VMware ESXi 5.5 into 4 virtual machines:

- **CI** - 4 vCPUs, 8GB RAM, 500GB storage
- **SM** - 8 vCPUs, 6GB RAM, 256GB storage
- **SM1** - 4 vCPUs, 10GB RAM, 260GB storage
- **SM2** - 2 vCPUs, 4GB RAM, 254GB storage
- **AP** - 4 vCPUs, 5GB RAM, 5GB storage

The virtual machines have separate roles, as follows:

**CI** - continuous integration using Jenkins, development using WebRatio using VNC access, SonarQube for code analysis, JBoss FUSE ESB, MySQL server with testing and production data, Sonatype Nexus for repository management, Tomcat 6 for testing

All SM VMs come together to create a small Hadoop cluster that can process data in a distributed, scalable and high availability fashion.

**SM** - Ambari for monitoring of the Hadoop system, YARN App Timeline Server, Ganglia Server, MapReduce2 History Server, Nagios Server, YARN Resource Manager, HDFS SNameNode, ZooKeeper Server, HDFS DataNode, Ganglia Monitoring, YARN NodeManager

**SM1** - HDFS NameNode, Oozie Server, ZooKeeper Server, Ganglia Monitoring, YARN NodeManager, FTP Server for receiving XML files from SES, SMDMC Manager for managing the processing flow of the data received from the water utility.

**SM2** - HDFS DataNode, ZooKeeper Server, Ganglia Monitoring, YARN NodeManager

As for clients, all SM VMs have installed: HDFS Client, MapReduce2 Client, Oozie Client, Pig, Sqoop, Tez Client, YARN Client, ZooKeeper Client.

**AP** - CentOS 7, Java 1.7, Tomcat 7, Jboss Fuse, ESB, Customer Portal, Gamification Engine, Business Dashboard

**PM** - power management, APC PowerChute appliance.

Ambari is the central piece, it monitors and starts the hadoop services. Oozie is used as the job scheduler for the data processing, it distributes the load and keeps the flow in check, providing feedback if and how a processing job fails. The Oozie jobs are started by the SMDMC component that uses Apache Camel to create, start and manage the Oozie job.

Figure 43 illustrates the software artifacts and how the VMs perform together.
4.2 Production Environment Deployment

The Production Environment will have a different virtualization layer than the Development Environment. Instead of VMWare virtualization layer, it will employ OpenStack ([www.openstack.org](http://www.openstack.org)) virtualization environment which is specialized in Cloud Deployments. OpenStack can manage large pools of hardware resources and provide high-availability, scalability, storage and computing for cloud infrastructures.
The main components of OpenStack framework with respect to the picture above are:

- **Compute**
  - Cloud fabric controller (Nova) - Compute architecture designed to scale horizontally on standard both virtual and bare-metal hardware

- **Storage**
  - Object Storage (Swift) - scalable redundant file and object level distributed storage
  - Block Storage (Cinder) - provide persistent block-level distributed storage

- **Networking**
  - Neutron - system for managing networks and IP addresses

- **Dashboard**
  - Horizon - graphical user interface to access, provision and automate cloud-based servers

- **Services**
  - Identity Service (Keystone) - repository of users mapped to services they can access
  - Image Service (Glance) - provides discovery, registration, and delivery services for disk and server images

Every server in Production Environment will run over the OpenStack cloud infrastructure layer. The exact number of virtual servers deployed in the Production Environment will highly depend on the exact context of Water Utility technical and user requirements. The most important thing is that the SmartH2O both software and deployment architecture is scalable and can provide the Client flexibility to cover any real-life scenario.

The proposed architecture serves the requirements for a medium scale Production environment (approx. 10,000 water utility customers):
The mapping of SmartH2O platform on deployment architecture and technical details of each deployed server are presented in Table 2 below.

5. Conclusions and outlook

This deliverable is the first specification of the architecture and components of the SmartH2O platform. It contains the knowledge matured at month 9 of the project.

The overall architecture has been specified in terms of the major components, data stores, user interfaces, and system interfaces, as well as the principal control and data flows among them.

Several components have been examined at depth, which permitted us to identify clearly the supported use cases, and the required interfaces and message orchestrations.

Other components are under scrutiny, as they depend on the further refinement of the use cases in the demonstrators and on the progress of the scientific work in the more technical components, such as the pricing engine and user behaviour model components, which are due later in the project.

The specification of the architecture will be refined as the project progresses, and the result of this refinement will be incorporated in the documents accompanying the deliverables representing the various releases of the SmartH2O platform: Platform implementation and Integration D6.3 at month 12, D6.4 at month 24, and D6.5 at month 36.
6. References

7. ANNEX 1 – List of Languages, Frameworks and Technologies

SmartH2O components will use various technologies, frameworks and development languages. The choice of technology for each component passed several criteria:
- Ability to deliver required functionality
- Open Source
- Open Standard oriented
- Documentation
- Proven record in real-life exploitation
- Commitment for future enhancements and bug-fixing
- Alignment with the entire technical solution of the platform

Smart H2O platform will be constructed using several types of software building blocks:
- New components or sub-components, developed as part of the current project
- Frameworks and technologies: ex. J2EE, Apache Camel Route
- Application Servers: ex. Apache JBoss, JBoss Fuse, Apache Hadoop
- Database Servers: ex. MySQL
- Communication Servers: ex. FTP, SMTP
- Management and Administration components. ex. MySQL Workbench,

Each type of building block has different types of software characteristics. For example, a newly developed building block can be described by programming language used for development, frameworks and libraries used. An Application Server building block can be described by required operating systems.

For each SmartH2O component we detail below its most important software characteristics:

**SmartH2O Database**
- Operating system: Linux distribution
- MySQL database server
- Administration: Workbench client for MySQL administration and manual query execution

**ESB – Enterprise Service Bus**
- Operating system: Linux distribution
- Language: Java
- Application Server: JBoss Fuse
- Communication protocols: HTTP(S), REST Web Services
- Frameworks and technologies:
  - Apache Camel Route used to define messaging routes and orchestration between platform component
  - J2EE used to develop processing components

**Smart Meter Data Manager**
Back-end, batch oriented component that processes metered data and feeds the SmartH2O database with usage date.
- Operating system: Linux distribution
- Languages:
  - Java
  - Pig
  - SQL
- Application Servers:
  - Apache JBoss
  - Apache Hadoop cluster
- Frameworks and technologies:
Communication servers:
- FTP used to transfer metered usage files
- DBMS: MySQL relational database to store household and metered data
- Other storage: HDFS to store raw metered data files, intermediate processed metered data files

**Customer Portal**
Web application that manages Customer’s interaction with consumption data, games actions and rewards.
- Operating system: Linux distribution
- Languages:
  - Client side: IFML used for Model Driven Development, JavaScript, JQuery
  - Server side: IFML used for Model Driven Development, Java
- Frameworks and technologies: J2EE, REST Web Services

**Admin Portal**
Web application that manages Utility Admin interaction with Customers, consumption data, games actions and rewards.
- Operating system: Linux distribution
- Languages:
  - Client side: IFML used for Model Driven Development, JavaScript, JQuery
  - Server side: IFML used for Model Driven Development, Java
- Frameworks and technologies: J2EE, REST Web Services

**Gamification Engine**
Back-end component that manages definition of games actions and rewards and processes users’ actions
- Operating system: Linux distribution
- Languages:
  - Client side: IFML used for Model Driven Development, JavaScript, JQuery
  - Server side: IFML used for Model Driven Development, Java
- Frameworks and technologies: J2EE, REST Web Services

**Games Platform**
Mobile game trivia pattern to increase awareness regarding water consumption. Game result can be converted to game points that can be used by Gamification Engine.
- Operating system: Android, iOS
- Languages:
  - Client side: C#, Unity 3D Player
  - Server side: JavaScript (Node.js)
- Frameworks and technologies: Unity 3D Game Engine

**Models of User Behaviour**
Application that disaggregates user water consumption during the day and classifies users in segments.

This component does not have a software deliverable but a set of rules that will be implemented in Agent Based Modeling component

**Agent Based Modeling**
This component models user consumption behavior at a larger scale and estimates the impact of network effect due to users interactions.
- Operating system: Linux, MacOSX, Windows
- Languages:
  - Client side: Java, AnyLogic Simulation Platform
  - Server side: N/A
- Frameworks and technologies: Eclipse Framework

**Authentication Gateway**
- Operating system: Linux
- Languages:
  - Server side: Java
- Frameworks and technologies: OAUTH2

**Social Network Crawler and Data Analyser**
- Operating system: Ubuntu
- Database: MongoDB
- Languages:
  - Client side: Java
- Frameworks and technologies: Twitter Stream API

**Social Network Connector**
- Operating system: Ubuntu
- Languages:
  - Client side: Java
- Frameworks and technologies: Social Network REST API
8. ANNEX 2 – User Interaction Flows

The User Interaction details for Customer Portal and Admin Portal components are detailed in the following sections:

- Customer Portal Basic Version
- Customer Portal Advanced Version
- Admin Portal

The following sections describe, using the standardized modelling language IFML [Bramb2014] described next, the user interaction and backend processing of these components.

8.1 IFML in a Nutshell

IFML supports the platform-independent description of graphical user interfaces for applications deployed or accessed on such systems as desktop computers, laptops, PDAs, mobile phones, and tablets. The main focus is on the structure and behavior of the application as perceived by the end user. The modeling language also incorporates references to the data and business logic that influence the user’s experience. This is achieved respectively by referencing the domain model objects that provide the content displayed in the interface and the actions that can be triggered by interacting with the interface. This section introduces the essential features of IFML: its scope, the design rules behind it, its main modeling elements, and its role in the development process. The Section concludes with an initial example of the language.

8.1.1 Scope and perspectives

To better understand the aim and scope of IFML it may be useful to refer to the well-known Model-View-Controller (MVC) software architecture of an interactive application, shown in Figure 46. MVC distinguishes the application internal status and business logic (Model), their representation in the user interface (View) and the rules governing the response to the user’s interaction (Controller).

![Figure 46- the Model-View-Controller architecture of an interactive application](image)

IFML mainly describes the view, i.e., the content of the front end and the user interaction mechanisms available in the interface. More precisely, IFML covers various aspects of the user interface:

- The view structure: it expresses the general organization of the interface, in terms of ViewContainers, along with their nesting relationships, visibility, and

1See, for example, http://en.wikipedia.org/wiki/Model-view-controller.
reachability.

- The view content: it specifies what ViewContainers actually contain, in terms of ViewComponents, i.e., elements for content display and data entry. ViewComponents that display content are further characterized by a ContentBinding, which expresses where the published content comes from.
- The events: they are the occurrences that affect the state of the user interface, which can be produced by the user’s interaction, by the application itself, or by an external system.
- The event transitions: they specify the consequences of an event on the user interface, which can be the change of the ViewContainer, the update of the content on display, the triggering of an action, or a mix of these effects.
- The parameter binding: it clarifies the input-output dependencies between ViewComponents, view containers, and actions.

For the sake of conciseness, IFML condenses all these perspectives within one diagram type only, called Interaction Flow Diagram, as opposed to other modeling languages, such as UML, which rely on multiple diagrams for conveying the various facets of an application.

Besides describing the view part of the application, an IFML Interaction Flow Diagram also provides the hooks to connect it with the model and controller parts:

- With respect to the controller, IFML represents the effects of the user's interactions; it defines the events produced in the view and the course of action taken by the controller in response to them, such as triggering a business component and updating the view.
- With respect to the model, IFML describes the data binding between the interface elements and the objects that embody the state of the application, as well the actions that are triggered by the user's interactions.

Figure 47 shows as an initial example the IFML model of a simple interface: the view structure consists of three ViewContainers (“ProductCategories”, “ProductOfCategory”, and “ProductInformation”), which reflect the top-level organization of the GUI in three distinct pages. The model shows the content of each ViewContainer: for example, the “ProductCategories” ViewContainer comprises one ViewComponent called “CategoryList”. This notation represents the content of the respective page in the GUI, i.e., a list of product categories. Events are represented in IFML as circles: the “SelectCategory” event specifies that the “CategoryList” component is interactive. In fact, in the GUI the user can select one of...
the categories to access the list its products. The effect of the “SelectCategory” event is represented by the arrow emanating from it (called InteractionFlow in IFML): it specifies that the triggering of the event causes the display of the “ProductOfCategory” ViewContainer and the rendering of its “ProductList” ViewComponent, i.e., the list of products of the selected category. The input-output dependency between the “CategoryList” and the “ProductList” ViewComponents is represented as a parameter binding (the IFML ParameterBindingGroup element in Figure 47): the value of the “SelectedCategory” parameter, which denotes the object selected by the user in the “CategoryList” ViewComponent, is associated with the value of the input parameter “Category”, which is requested for the computation of the “ProductList” ViewComponent.

### 8.1.2 Overview of IFML main concepts

An IFML diagram consists of one or more top-level ViewContainers, i.e., interface elements that comprise components for displaying content and supporting interactions.

![IFML Diagram Examples](image)

**Figure 48: example of different top-level interface structures**

Figure 48 contrasts two different organizations of the GUI: a mail desktop or rich internet application (a) consists of a top-level container with embedded sub-containers at different levels; an e-commerce web site (b) organizes the user interface into different independent view containers corresponding to page templates.

Each view container can be internally structured in a *hierarchy of sub-containers*. For example, in a desktop or rich internet application, the main window can contain multiple tabbed frames, which in turn may contain several nested panes. The child view containers nested within a parent view container can be displayed simultaneously (e.g., an object pane and a property pane) or in *mutual exclusion* (e.g., two alternative tabs). In case of mutually exclusive (XOR) containers one could be the *default container*, displayed by default when the parent container is accessed. The meaning of a container can be specified more precisely, by adding a stereotype to the general-purpose construct. For instance, a ViewContainer can be tagged as «window», as in the case of the “Mail” ViewContainer in Figure 49, to hint at the nature of its expected implementation.
In Figure 49, the “Mail” top-level container comprises two sub-containers, displayed alternatively: one for messages and one for contacts. When the top level container is accessed, by default the interface displays the “Messages” ViewContainer.

A ViewContainer can contain ViewComponents, which denote the publication of content (e.g., a list of objects) or the input of data (e.g., entry forms).

Figure 50 shows the notation for embedding ViewComponents within ViewContainers: the “Search” ViewContainer comprises a “MessageKeywordSearch” ViewComponent that represents a form for searching; the “MailBox” ViewContainer comprises a “MessageList” ViewComponent that denotes a list of objects.

A ViewComponent can have input and output parameters. For example, a ViewComponent that shows the details of an object has an input parameter corresponding to the identifier of the object to display; a data entry form exposes as output parameters the values submitted by the user; and a list of items exports as output parameter the item selected by the user.

A ViewContainer and a ViewComponent can be associated with events, to express that they support the user’s interaction. For example, a ViewComponent that shows a list associated with an event for selecting one or more items, a form associated with an event for input submission, or an image gallery associated with an event for scrolling through the gallery. IFML events are mapped to interactors\(^2\) in the implemented application. The way in which such interactors are rendered depends on the specific platform for which the application is deployed and is not captured by IFML, but is rather delegated to transformation rules from Platform-Independent Model (PIM) to Platform-Specific Model (PSM). For example, the scrolling of an image gallery may be implemented as a link in an HTML

---

\(^2\) By interactor we mean any interface widget that supports the user’s interaction, such as a button, a link, a check box, and so on.
application and as a swipe gesture handler in a mobile phone application.

The effect of an event is represented by an interaction flow, which connects the event to the ViewContainer or ViewComponent affected by the event. For example, in an HTML web application the event produced by the selection of one item from a list may cause the display of a new page with the details of the selected object. This effect is represented by an interaction flow connecting the event associated with the list component in a top-level ViewContainer (the web page) with the ViewComponent representing the object detail, positioned in a different ViewContainer (the target web page). The interaction flow expresses a change of state of the user interface: the occurrence of the event causes a transition from a source to a target web page.

For example, in Figure 51 the “MailBoxList” ViewComponent shows the list of available mailboxes and is associated with the “MailBoxSelection” event, whereby the user can open the “MailBox” ViewContainer and access the messages of the mailbox selected in the “MessageList” ViewComponent.

Figure 51 - Example of interaction flow between ViewComponents

An event can also cause the triggering of an action, which is executed prior to updating the state of the user interface; the effect of an event firing an action is represented by an interaction flow connecting the event to an action symbol, consisting of an hexagon. For example, in a mail management application the user can select several messages from a list to delete them; the selection event triggers a delete action, after which the ViewContainer with the updated list is displayed again. The result of action execution is represented by an interaction flow that connects the action to the ViewContainer or ViewComponent affected by it.

In Figure 52, The “Message toolbar” ViewContainer is associated with the events for deleting, archiving and reporting mail messages. Such events are connected by a flow to an action symbol (a labelled hexagonal icon), which represents the business operation. The outgoing flow of the action points to the ViewContainer displayed after the action is executed; if the outgoing flow of an action is omitted, this means that the same ViewContainer wherefrom the action has been activated remains in view (as illustrated for the “Archive” and “Report” actions in Figure 52).
The model of Figure 52 does not express the objects on which the business actions operate. Such an input-output dependency between view elements (ViewContainers and ViewComponents) or between view elements and actions requires the specification of parameter bindings associated with interaction flows. More specifically, two kinds of interaction flows can host parameter bindings: navigation flows, which represent navigation between view elements, and data flows, which express data transfer only, not produced by the user’s interaction. Parameter binding rules are represented by annotations attached to navigation and data flows, as shown in Figure 53.

In Figure 53, the “MessageToolbar” ViewContainer has an input parameter “MessageSet”; its value is set to the messages selected from the “MessageList” ViewComponent, when the user produces the “MessageSelection” event. Another parameter binding rule is associated with the Delete, Archive and Report events: the value of the “MessageSet” parameter is bound to the “InputMessages” parameter of the triggered action.
8.1.3 Role of IFML in the development process

The development of interactive applications is typically managed with agile approaches, which traverse several cycles of "problem discovery" / "design refinement" / "implementation". Each iteration of the development process generates a prototype or a partial version of the system. Such an incremental lifecycle is particularly appropriate for modern Web and mobile applications, which must be deployed quickly and change frequently during their lifetime to adapt to the user's requirements. Figure 54 schematizes a possible development process and positions IFML within the flow of activities.

Figure 54 - role of IFML in the development process of an interactive application

8.1.4 A complete example

As a conclusion to this brief introduction of IFML and before the details of the complete IFML specifications of the SmartH2O platform front-end, we present a simple, yet complete, example. The application is an online store, where the user can browse products, such as books, music and software, and add products to his shopping cart, as shown by the UML use case diagram of Figure 55

Figure 55 - use cases of the Bookstore application

The application has a Web front-end; in the “Browse books” use case, the user accesses a home page, which contains a list of product categories. Clicking on a product category, such as Books, leads to a page displaying the summary data about all the items of that category; clicking on a “See more” associated with one item's summary opens a page where the full details of the selected object are presented. Figure 56 shows the mock-ups of the application front-end supporting the “Browse books” use case.
When looking at the details of an item, the user can press the “Add to cart” button to insert it in his trolley; a modal window appears, where the user can insert the quantity of goods he wants to purchase; after submitting the desired quantity, a confirmation pop-up window is presented to acknowledge the addition of the product to the cart. Figure 57 shows the mock-ups of the interface supporting the “Manage cart” use case.

The IFML model of the Bookstore application contains the five ViewContainers shown in Figure 58.
The ViewContainers are annotated with stereotypes (such as H for “Home”, L for “Landmark” and “Modal” and “Modeless”), which further specify their properties. The ViewContainers definition is refined by specifying the ViewComponents they comprise, as illustrated in Figure 59.

Interactivity is represented by adding the relevant events and specifying the interaction flows they trigger, completed with the parameter binding between the source and the target components of the interaction flows. The model of Figure 60 shows that the “CategoryList”
ViewComponent supports an interactive event “SelectCategory”, whereby the user can choose a category from the index; as a result, the “ProductOfCategory” page is displayed, and the “ProductList” ViewComponent shows the items corresponding to the chosen category. The input-output dependency between the “CategoryList” and the “ProductList” ViewComponents is represented by the parameter binding group, which associates the “SelectedCategory” output parameter of the source component with the “Category” input parameter of the target component. The same modeling pattern is used to express the interaction for selecting a product from the “ProductList” component and then accessing its data in the “ProductDetails” component.

Some event may trigger the execution of a piece of business logic; as an example Figure 57 and Figure 61 show the activation of an action for inserting items in the shopping cart: after the user presses the “Add to cart” button associated with the “ProductDetails” component, a modal window appears asking for the quantity of items desired. The quantity submission event triggers the execution of the “Add to cart” action. The quantity value from the Form ViewComponent and the “DisplayedProduct” parameter from the “ProductDetails” ViewComponent are submitted as input parameters to the “Add to cart” action. Once the action is completed, a confirmation window is displayed.

Notice that the binding of the “Quantity” output parameter is associated with an interaction flow, which denotes the effect of a submit event that requires the user’s interaction; conversely, the binding of the “DisplayedProduct” parameter is associated with a data flow, which merely expresses an input-output dependency, automatically performed by the system and not triggered by a user’s interaction.
