## 1. Final publishable summary report

### 1.1 Executive summary

The Consortium has succeeded to fulfil all the most important and ambitious objectives of the project. The extremely challenging objective of controlling the sign of the spin transfer at the interface (objective still critical in inorganic spintronics) has been achieved even in two different ways: by chemical tailoring of the interface (foreseen in the workplan) and by electric interfacial tuning (discovered by HINTS). While the former allows to select the sign during sample fabrication, the latter, attributable to a smart multifunctional interface behaviour, allows to change the sign during the device operation (reconfigurable operation). HINTS succeeded to bring to 11V the voltage interval where the magnetoresistance is detected, while the workplan objective was 3-5V. While highest voltage operation was detected at low T (<50 K), some materials maintained these properties up to 200-250K close to room temperature operation. This achievement paves the way for future detailed investigation of spin polarized effects on OLED behaviour, considering such parameters as efficiency, colour and other. Indeed, HINTS anticipated this by showing unequivocal and strong effect of spin polarization of driving currents on OLEDs (HyLEDs) electroluminescence.

Realization of continuous interfacial tailoring layers and realization of HOI interfaces with sharpness of 1 nm (approximately one molecule size) have been achieved. This achievement exceeds the state-of-the-art quality of interfaces in OLED and OFET devices and could be applied beyond organic spintronic applications.

Interfacial proximity effect was found to embody the most powerful tailoring method for the control of spin transfer across HOI interfaces. The energy of this effect exceed room temperature promoting routes for conceptually new device paradigms. Innovative devices based on rich linear and nonlinear interface effects will definitely represent most proficient application and research line on the short and short-medium terms.

The modification of interfacial spin transfer by insertion of magnetic molecules (high spin) was also achieved. While this fulfils the objectives of the project, the modification was generally negative. Revealing the full potential of merging together the fields of spintronics and molecular magnetism would represent the topic for a fully dedicated project or even number of projects and will for sure constitute one of the most advantageous future research lines. A disruptive progress was achieved by a joint experimental-theoretical effort concerning the basic rules governing the spin transfer at HOI interfaces. HINTS looked "inside the interface" revealing how the spin dependent residence time is distributed in the first 2-3 monolayers of the organic semiconductor. The spin dependent residence time at the interface was proposed as a key parameter for the spin filtering capability. The model, based on spin dependent band broadening and energy shifts, was strongly upgraded by HINTS. Both approaches indicate robust room temperature spin transfer and spin selectivity outcomes.

On the theoretical side it has been revealed for the first time the enormous role in spin injection and transport of the resistance non-linearity in organic semiconductors. The built model defines the set of parameters, such as interface resistance, organic resistance, voltage and others, able to provide the detection of the magnetoresistance (similarly to conductivity mismatch effect in inorganic spintronic devices).

The involvement of industrial partners in the main project objectives has further grown up. Thus, two equipment producing partners succeeded to develop useful modifications to their commercial products as stimulated by the needs of HINTS requirements to the interface.

HINTS was funded with 3,874,360.00 € granted by the European Commission in the 7<sup>th</sup> Framework Programme, coordinated by Dr. Valentin Dediu of the Institute for the Study of Nanostructured Materials - ISMN (Italy), and carried out by a consortium of 14 leading research institutions coming from 8 Countries, each of them with specific roles and different levels of involvement.

## 1.2 A summary description of project context and objectives

HINTS main goal was to advance new solutions for spintronic devices via the control and the tunability of the interface spin-transfer efficiency. It was the first time a research program addressed so methodically this subject, aiming essentially at putting the basis of a new generation of spintronic devices able to go beyond current GMR and TMR (commercial) achievements. Hybrid organic-inorganic (HOI) materials and interfaces were the materials of choice, featuring such advantage as the low-cost processing and the greatest choice of molecules.

All the main objectives of the project have been successfully fulfilled.

### **HINTS OBJECTIVES and HINTS SOLUTIONS**

Develop innovative HOI materials with interfaces exhibiting binding interactions specifically tailored for targeted spin transfer properties => Various combinations of materials have been fabricated and investigated along three tailoring approaches: proximity effect, dipole tailoring, magnetic molecule tailoring.

**Establish the basic rules governing the spin transfer behaviour at HOI Interfaces with different chemical bonds** => Disruptive success achieved in joint experimental-theoretical work: proposed both a DFT based description and a phenomenological model able to describe both interfacial spin injection and spin transport inside the organic medium.

As a consequence of the newly developed knowledge: fabricate a set of HOI materials with interfaces that allow for enhanced control of spin-selectivity => Chemical and electric interfacial tailoring have lead to a selectivity control exceeding 100% (sign reversal achieved).

Design a set of HOI materials with tunable interfaces featuring a high (above 90%) spin transfer efficiency => Some interfaces showed spin transfer close to 100%.

Develop HOI Interfaces with efficient spin injection at high bias voltages compatible with new ICT applications for hybrid Spintronics materials (3-5 V electrical bias) => Achieved spin injection at 11 V, outstanding achievement opening the door for applying spintronic effects in OLEDs and OFETs.

Develop new processing technologies and protocols able to maintain the Spintronics parameters of HOI interfaces on large area (3-inches standard) wafers in UHV conditions => demonstrated evaporation of HOI materials on 3" substrates with thickness homogeneity exceeding 95 % and a material utilisation efficiency of 15%.

Develop new processing technologies and protocols allowing for decreased material consumption for both UHV and solution processing methods => High TRL value achieve introducing (low) consumption modifications to prototypes of commercial effusion cells (UHV). Breakthrough research performed for the utilization of solution processing in organic spintronics.

Select HOI materials with interfaces able to maintain high spin-charge transfer efficiency under conditions compatible with flexible electronics requirements => while representing a secondary objective by dedicated effort, excellent compatibility between selected HOI materials and flexible substrates demonstrated.

**Assessment of the innovative HOI materials with regard to selected ICT applications** => HINTS dedicated significant efforts to these aspects under the guidance of industrial partners.

Assessment of the innovative HOI materials towards roadmapping trends and development of a set of proposals for the update of ICT roadmaps => A set of roadmapping recommendations developed.

### 1.3 A description of the main S&T results/foregrounds

The main achievements of the project are presented for clarity in the table below.

WP1		
Selected results	Brief description	Partners involved
	<p>Molecular driven magnetism on reactive metal surfaces.</p> <p>The outcome of this study provides an alternative way to create spin-polarized interfaces, relying on the interaction between high-spin quinoline molecules (Tb<sub>3</sub>q<sub>9</sub>) and <i>non-magnetic</i> metallic surfaces. The molecules preserve their structural, chemical and magnetic properties when deposited onto noble metal (Au) and passivated (SiO<sub>2</sub>) surfaces; while the adsorption on reactive metals such as Cu induces a magnetic phase at the interface involving molecular Tb-atoms, as measured via SQUID magnetometry and element-specific X-ray magnetic circular dichroism (XMCD). Remarkably, the magnetic ordering at the hybrid interface persists up to room-temperature for the Tb<sub>3</sub>q<sub>9</sub>/Cu system and is linked to a chemically-triggered change in structure and stoichiometry of the interfacial species. On the one hand, our work provides a route towards a controllable “magnetic doping” of a metal surface through molecular adsorption, while on the other hand, the creation of a magnetically active interface between a <i>non-magnetic</i> metal and a high-spin molecular layer opens new avenues for the design of a new class of molecular-based spintronic devices.</p> <p><i>Paper submitted 2014.</i></p>	<p>NANOG (leader), UVEG, TCD, UNIKL, LiU</p> <p><b>Scientific Impact:</b> Fully innovative knowledge concerning proximity effects.</p> <p><b>Application Impact:</b> Possibly innovative technological approach for tailoring interfaces.</p>
	<p>Dipole-layer: tuning work function and spin polarization.</p> <p>We use strong donor and acceptor molecules with p-orbitals to tune energy level alignment and magnetic properties of the FM-based (Fe, Co, Ni) HIS</p> <p>Utilizing the acceptor molecules (TCNE, TNAP and TCNQ) we can achieve high work function HIS with effective WF in the tunable range of 5.0 to 5.7 eV, suitable for hole injection</p> <p>The donor molecule, AOB, allows us to create low work function HIS with an effective WF ~3.4 eV</p> <p>Organic Electronics, 15 (2104) 1951; Advanced Functional Materials, 24 (2014) 4812; Manuscript in preparation.</p>	<p>LiU, UNIKL, CNRS, NANOG</p> <p><b>Scientific Impact:</b> Fully innovative knowledge concerning proximity effects.</p> <p><b>Application Impact:</b> Possibly innovative technological approach for tailoring interfaces.</p>
	<p>Growth of Self-assembled monolayer of dipolar molecules on LSMO surfaces.</p> <p>(La,Sr)MnO<sub>3</sub> manganite (LSMO) has emerged is widely used in organic spintronic devices due to its highly spin-polarized character and air stability. Whereas organic semiconductors and polymers have been mainly envisaged to propagate spin information, self-assembled monolayers (SAMs) have been overlooked and should be considered as promising materials for molecular engineering of HOI interfaces. Surprisingly, up to now</p>	<p>CNRS, Thales, UVEG</p> <p><b>Scientific Impact:</b> First ever grafting of SAM on LSMO surface. Efficient spin injection achieved.</p>

WP1		
Selected results	Brief description	Partners involved
	<p>the first key step of SAM grafting protocols over LSMO surface thin films is still missing. Demonstrated that alkylphosphonic acid groups can be used as the preferred anchoring group when dealing with the self-assembled monolayer functionalization of the standard ferromagnetic electrode material LSMO. Hence alkylphosphonic acid based SAMs are suitable to design HOI interfaces with an indirect contact between spin injector (SI) and spin collector (SC). <i>ACS Nano</i> 6, 8753 (2012)</p>	<p><b>Application Impact:</b> Compatibility of most advanced spintronic interfaces with cheap solution processes demonstrated.</p>
	<p>A new concept of fabricating organic spin valve (OSV), concretely fabrication of organic semiconductor from solution methods instead of expensive and complicated evaporation techniques besides we introduced the use of ionic molecular monolayer in the fabrication of a light-emitted OSV. It was established for the first time an OSV and a spin-polarized electroluminescent device with ferromagnetic electrodes that acts as a bipolar OSV, based in solution and low cost methods. Our OSV shows a spin valve magneto electroluminescence (MEL) effect of around 1%.</p>	<p>UVEG, CNR <b>Scientific Impact:</b> High efficient light emission at conditions compatible with spin polarized injection <b>Application Impact:</b> Enables the possibility to control light emission in OLEDs by magnetic field (efficiency, read-write options etc)</p>
	<p>Growth of Self-Assembled Monolayer of dipolar molecules on Permalloy and Cobalt surfaces</p> <p>The fact the LSMO's surface Curie temperature (<math>T_c</math>) is close to room temperature, implies that spintronic effects in LSMO-based devices are expected only at low temperature. Hence, after the interesting results obtained using self-assembled monolayers (SAMs) on LSMO as interfaces between spin injector and spin collector in basic spintronic devices, it will be desirable to substitute LSMO by a ferromagnet of higher <math>T_c</math>, as for example ferromagnetic (FM) metals or alloys, like cobalt (Co) or permalloy (Py). Unlike LSMO, FM metals readily oxidize and it is not surprising that SAM grafting protocols over FM electrodes are almost non-existing. We have developed the grafting protocols necessary for the integration of SAMs on 3d FM metals with solution approaches. The formation of SAMs on Co and Py both under ambient conditions and in inert atmosphere, after removing the oxide with a simple wet etching process, have been achieved. We have observed that comparing with oxidized Py or Co, the ferromagnetic behaviour of the substrate can be improved during the solution processes. By standard characterizations it is probed that only thiol group can be successfully grafted on ferromagnetic surfaces whereas phosphonic acids group</p>	<p>UVEG, CNRS, Thales <b>Scientific Impact:</b> Grafting protocols of SAM on clean and oxidized ferromagnetic metallic surfaces in glove box conditions. <b>Application Impact:</b> Compatibility of most advanced spintronic interfaces with cheap solution processes demonstrated.</p>

WP2		
Selected results	Brief description	Partners involved
	<p>Determination of the metal-molecule energy-level alignment by in-device spectroscopy</p> <p>In this study, we have shown that the energy alignment at metal/molecule interfaces can be measured in a chip by the fabrication of a simple 3-terminal device. As a proof of principle, we measured the energy barriers at the interfaces between C<sub>60</sub> and different metals. Furthermore, such a device can be used to inject carriers in the organic layer overcoming the contact resistance. This property allows the injection of a highly spin-polarized current into a molecular layer and to study its conduction properties at very low temperatures, in a range where the contact resistance usually prevents any carrier injection. We anticipate that this scheme for charge injection free from the contact resistance is not limited to bulk semiconductors, but can be extended in principle to any semiconductor, including solution-processable semiconductors and monolayer dichalcogenides.</p> <p><b>Nature Communications</b> 4, 2794 (2014)</p>	<p>NANOG</p> <p><b>Scientific Impact:</b> New HOI interface characterized</p> <p><b>Application Impact:</b> Innovative and cheap approach for interface energetics in HOI based devices</p>
<p>STM image for a MPC/CoOx/Co interface showing self assembly of the MPC molecules (not found on bare Co)</p>	<p>A 1/2 ML of oxygen on the Co(001) surface acts as a „wetting“ layer. STM measurements show that MPC’s generally form self-assembled layers on such an ultrathin oxygen layer. We found that oxidation of the cobalt going from 1/2 ML to higher thickness leads to a gradual suppression of hybrid interface states, and moreover to a progressive change in the work function as also seen for the Co-Mq3 interface.</p>	<p>UNIKL</p> <p><b>Scientific Impact:</b> Oxygen layer effect on interface hybridization.</p> <p><b>Application Impact:</b> Possible tailoring approach.</p>
<p>STM image for a MPC/Co interface showing no „real“ ordering because of the high reactivity of the Co also seen in the existence of HIS for all the phthalocyanine</p>	<p>STM measurements show that for MPC’s on Co there is no “real” ordering as seen for the self-assembled layers on the MPC/CoOx/Co system. No decoration on the edge of the surface terraces indicates the high reactivity found for all the MPCs on the native Co surface. The surface dipole saturates for all the MPC systems including H<sub>2</sub>Pc when reaching 1 monolayer (ML) indicating the interaction with the substrate is related to the first monolayer. UPS measurements (He I and He II) clearly show that the H<sub>2</sub>Pc-MnPc molecules bind strongly to the Co surface and are forming HIS near/at the Fermi level.</p> <p><b>Advanced Functional Materials</b>, 22, 989 (2012)</p>	<p>UNIKL</p> <p><b>Scientific Impact:</b> Confirming the role of the oxygen layer</p> <p><b>Application Impact:</b> Possible tailoring approach.</p>

<p>Al on unexposed Gaq3      Al on O<sub>2</sub> exposed Gaq3</p>	<p>Key improvements of the Interface Co/AIOx/Alq3                  It was demonstrated by Hard X ray photoemission spectroscopy and TEM analysis that exposure of Alq3 to O2 before the deposition of metal provides a much better top electrode/organic interface characterized by higher morphological and chemical sharpness (1-2 nm interface width).                  Paper in preparation 2014.</p>	<p>CNR  <b>Scientific Impact:</b>                  Burried interface investigated  <b>Application Impact:</b>                  New routes for direct deposition of reactive metals on Alq3</p>
---	---	--

WP3		
Selected results	Brief description	Partners involved
	<p>Static characterization of the Co-Mq3 interface                  We have used spin-resolved photoemission spectroscopy to study the static spin-dependent electronic properties of the interface formed between cobalt as ferromagnetic electrode and three metal quinolines: Alq3, Gaq3 and Inq3. By combining ultra-violet-photoemission spectroscopy (UPS), spin-resolved near-threshold photoemission spectroscopy (NT-PS), spin-resolved two-photon photoemission (2PPE) spectroscopy and state-of-art density functional theory (DFT) calculations (performed in WP1), our study unequivocally shows that all three Mq3 molecules bind so strongly to the surface that spin-polarised interface states are formed. Interestingly, the interface electronic structure is very similar in all cases. This is a consequence of the fact that for all the three molecules, the HOMOs are localised on the phenoxide moiety of the ligands, while the three LUMOs on the pyridyl moiety: thus almost no charge is localised on the metal centres.</p> <p><i>PRB 89, 094412 (2014)</i></p>	<p>UNIKL, TCD  <b>Scientific Impact:</b>                  Accurate detection of proximity induced purely interface spin polarized states.  <b>Application Impact:</b>                  Enable conceptually new device paradigms based on non-linear interface behaviour.</p>
	<p>Formation of hybrid interfaces                  We have studied the formation of hybrid interfaces by two complementary spectroscopic methods: spin-polarized STS (scanning tunneling spectroscopy) and spin-polarized NT-PS (near threshold- photoemission spectroscopy).                  Both methods give evidence for the formation of spin polarized hybrid interface states in the energetic region close to the Fermi level.</p> <p><i>PRB 84, 224403 (2011)</i></p>	<p>UNIKL  <b>Scientific Impact:</b>                  Definition of the energetics of the proximity induced interface states.  <b>Application Impact:</b>                  Enable conceptually new device paradigms based on non-linear interface behaviour.</p>

WP3		
Selected results	Brief description	Partners involved
	<p>Chemical tailoring of the spin properties of the Co-Mq3 interface</p> <p>We have created different experimental molecules to tailor the spin-dependent properties of the interface by modifying chemisorption with cobalt. For example, Al(OP)3 was developed to produce a ligand that has more extended p-systems than Alq3. We expect a modification of the chemisorption on cobalt, and thus different spin-dependent properties of the Co/Al(OP)3 interface with respect to Co/Alq3. Using spin-resolved photoemission methods, we have indeed identified two hybrid interface-states in the energy window of 2 eV below the Fermi energy, in contrast to the Co/Alq3 interface where only one hybrid state is present.</p> <p><i>NJP 15, 113054 (2013)</i></p>	UNIKL, TCD  <b>Scientific Impact:</b> New (HINTS developed) molecules show modified interface hybridization.  <b>Application Impact:</b> Enable conceptually new device paradigms based on non-linear interface behaviour.
	<p>Physical tailoring of the spin properties of the Co-Alq3 interface</p> <p>We have used oxidation of the Co/Alq3 interface to control its electronic properties. Oxidation of cobalt is expected to dramatically influence the strength of hybridization with the deposited molecules, and as a consequence the spin-dependent electronic properties of the interface. By UPS, NT-PS and 2PPE we found indeed that oxidation of the cobalt leads to a gradual suppression of hybrid interface states, and moreover to a progressive change in the work function and to a continuous energetic shift of the molecular orbitals towards higher binding energies. Based on our spectroscopic observations, we have suggested controlled oxidation of the ferromagnetic electrode as an easy and effective possibility to tune the spin-properties of metal/organic interfaces.</p> <p><i>APL 103, 251603 (2013)</i></p>	UNIKL  <b>Scientific Impact:</b> Defined the role of superficial oxygen on spin polarization.  <b>Application Impact:</b> Enable soft interface modifications in future HOI devices
	<p>Microscopic understanding of hybrid metal-organic interfaces</p> <p>We have used spin- and time-resolved two-photon photoemission to study the spin-dependent electron relaxation across hybrid interfaces. We found that electrons injected across hybrid interfaces are trapped into hybrid interface states in a spin-dependent manner for a surprisingly long time of the order of 0.5–1 ps. This is the microscopic origin of the spin-filtering properties of hybrid interfaces. The achieved microscopic understanding of the spin-dependent dynamics at hybrid interfaces lays the foundation for designing advanced actively controlled spintronics devices.</p> <p><i>Nature Phys. 9, 242–247 (2013)</i>  <i>Nature Phys. 9, 210–211 (2013)</i></p>	UNIKL, CNR  <b>Scientific Impact:</b> Outstanding achievement – first look “inside” the interface.  <b>Application Impact:</b> Promotes new ways to describe key device parameters. Room temperature operation.

WP3		
Selected results	Brief description	Partners involved
<p>FIGURE CONFIDENTIAL</p>	<p>Coherent excitation of hybrid interface states We have performed phase-stabilized two-photon photoemission experiments at the Co-Alq3 interface to probe the coherence of the optical excitation across hybrid interfaces. We have found long-lived excitations with coherence times of up to 110fs. This demonstration of coherent control of spin polarized hybrid interface states opens the way to ultrafast spin control at the molecular scale.</p>	<p>UNIKL <b>Scientific Impact:</b> found long-lived excitations with coherence times of up to 110fs <b>Application Impact:</b> opens the way to ultrafast spin control at the molecular scale.</p>
	<p>Spin-polarization loss at insulator/organic interfaces We have investigate the influence of the tunnel barrier MgO inserted at the interface between the spin injector CoFe and the organic semiconductor C60 by spin-resolved photoemission spectroscopy. At the CoFe/C60 interface the spin polarization persist up to 15nm C60 thickness and decrease linearly with C60 thickness and decrease linearly with C60 thickness. At the CoFe/MgO/C60 interface, however, we observe a drastic reduction of the spin polarization directly at the interface between C60 and MgO, indicating an enhanced spin-scattering rate at the insulator/organic interface.</p>	<p>UNIKL <b>Scientific Impact:</b> MgO barrier strongly reduce the spin transfer efficiency <b>Application Impact:</b> Nearly 100% spin transfer – CoFe/ C60 interface is among best candidates for device applications.</p>
	<p>A nonlinear behavior of a logarithmic plot of the PES intensities in the region below <math>E_F</math> show the existence of HIS formed by the hybridization reaction. Using a modified Lambert-Beer law, SP-UPS measurements clearly show differences in the spin down channel just below <math>E_F</math> for the different MPC's and the pure organic system <math>H_2Pc</math>. By using a very recently published model describing the interaction of the carbon <math>p_z</math> orbitals with a FM, the main structures in the spin down channel at 1.1 eV and the structure at 0.3 eV in the spin up channel are attributed to the interaction of the phenyl-ring system with the metal substrate d orbitals. These structures are consistent with calculations which were also made by the partner TCD for the system MPC/Co. The differences for the spin down channel just below <math>E_F</math> are therefore density of states which must be attributed to the metal atom d-states changing the DOS at the Fermi level and still reflects the importance of the geometry of the open shell frontier orbitals in MPC's for the discussion of spin polarization effects at the interface.</p>	<p>UNIKL <b>Scientific Impact:</b> quantitative description of hybridized interface states <b>Application Impact:</b> Important as characterization method for device interfaces</p>

WP3		
Selected results	Brief description	Partners involved
	<p>In SP-UPS spectra a 1/2 ML of oxygen on the Co(001) surface clearly shows a strong majority polarization vanishing rapidly going to higher oxygen layers. This polarization is also described in DFTGGA+U calculations for a 1/2 ML on Co. This clearly shows that a very small amount of oxygen is not “magnetically dead”. Measurements of the spin polarization for the two archetypical MPC’s, CuPc and FePc, show slight differences. The SP-UPS spectra we measure were then correlated with some DFT calculations of the system MPC/CoOx/Co(001) indicating that the differences we investigate matches with two separate interaction mechanisms which were caused by the differences in the geometry of the open shell frontier orbitals of the MPC’s central atom and therefore the interaction path. Therefore the results on the MPC/CoOx/Co(001) also reflect the importance of the geometry of the open shell frontier orbitals in MPC’s for the discussion of spin polarization effects at the interface.</p>	<p>UNIKL</p> <p><b>Scientific Impact:</b> The strong interfacial effect of oxygen on spin polarization of the injecting surface. Also revealed the importance of the geometry of the frontier orbitals in metal phthalocyanines.</p> <p><b>Application Impact:</b> Important tailoring issues in vertical spintronic devices.</p>
	<p>UPS measurements in cooperation with partner LiU clearly show a charge redistribution seen by the enhancement of work function and a asymmetric behavior of the HOMO and HOMO-1 levels up to the first monolayer. SP-UPS measurements clearly show a spin-splitting of this two MO’s. A nonlinear behavior of a logarithmic plot of the PES intensity’s in the region below <math>E_F</math> clearly show the existence of HIS formed at the interface. A remaining high intensity in the spin DOS just below <math>E_F</math> furthermore indicates differences in the interaction mechanism with the Co substrate compared to one suggested for the MPC systems. These observations are important comparing them with <math>C_{60}</math> spin valves experiments which have been done.</p>	<p>UNIKL, LiU, NANOG</p> <p><b>Scientific Impact:</b> quantitative description of hybridized interface states</p> <p><b>Application Impact:</b> Important tailoring issues in vertical spintronic devices</p>
	<p>Multifunctional magnetic&amp;electric memory and logic gate</p> <p>Resistive bistability effect in organic (LSMO-Alq3-Co) spintronic devices was put at the basis of new device paradigm featuring both electric and magnetic memory (magnetically enhanced memristor). The device could be set in 32 different and reversible resistive states. The excellent control of the resistance is very promising for memory applications.</p> <p>In addition to memory capability, the device performs as logic gate – two logic gates, AND and IMP, have been experimentally demonstrated.</p> <p><b>Advanced Materials</b> 2013, 25, 534–538</p>	<p>CNR, QMUL</p> <p><b>Scientific Impact:</b> Full electrical control of the magnetoresistance achieved.</p> <p><b>Application Impact:</b> Important input for device paradigms conceptually different from inorganic spintronic devices.</p>
	<p>The absence of Hanle effect in prototypical devices. We investigated the Hanle effect, one of the main outstanding issues in organic spintronics. We have investigated it by measuring the GMR of a prototypical organic spintronic device at different angles between the</p>	<p>CNR, MLU</p> <p><b>Scientific Impact:</b> Crucial achievement questioning most of previously adopted</p>

WP3		
Selected results	Brief description	Partners involved
	<p>device's plane and the magnetic field, and we found no sign of its presence. Although we have no definitive explanation for this finding, an exceptionally high mobility (<math>30 \text{ cm}^2\text{V}^{-1} \text{ s}^{-1}</math>) would be sufficient to justify the present data. Altogether, these results strongly suggest that the current understanding of transport in organic GMR devices is not sufficiently developed to explain the absence of the observation of spin precession and supports the framework of transport occurring via high mobility, high conductivity channels.</p> <p><b>Appl. Phys. Lett.</b> <i>102</i>, 092407 (2013)</p>	<p>concepts for spin transport in organic materials. Immediately stimulated an intense discussion.</p> <p><b>Application Impact:</b> Allows to distinguish tunnelling and injection devices.</p>
	<p>Defect role in prototypical Alq<sub>3</sub> based devices</p> <p>From the comparison of the electrical resistance of the hundreds of spintronic devices fabricated over the course of the project, two regimes in the Resistance vs Thickness curve could be observed. The high resistance one, with a resistance that is proportional to the thickness of the organic layer, shows no MR; in this case we suppose that transport occurs via the LUMO and/or HOMO levels. Instead, the low resistance regime, highly variable between nominally identical samples, shows MR ; in this case the transport presumably occurs through defects. A meta-analys of the data available from the literature for comparable devices, follows the same pattern.</p> <p>Commented in <b>Nature Nanotechnology</b> <i>8</i>, 885 (2013)</p>	<p>CNR</p> <p><b>Scientific Impact:</b> Acquired significant indications for the key role of defects and impurities in the detection of MR in Alq<sub>3</sub> based devices.</p> <p><b>Application Impact:</b> Definition of optimal devices resistances and transport modes.</p>
	<p>Dipole layer HIS: work function and spin-polarization</p> <p>We used X-ray Magnetic Circular Dichroism to confirm spin-polarized hybridized <math>\sigma</math>-orbitals for TNAP/FM and TCBE/FM HOI. The spin-polarized occupied density of states of a particular TCNE/FM HOI, TCNE/Co, was then explored using spin-polarized ultraviolet photoelectron spectroscopy. According to the XMCD results and sum rules, TCNQ and TNAP adlayers have no detrimental influence on the spin polarization of the FM surface whereas AOB adlayers reduce the spin polarization of the FM surface. The results demonstrate that high and low effective work function FM-OS HIS with spin-polarized <math>\sigma</math>-orbitals at the interface can be achieved but also demonstrates that the OS-FM interaction can negatively impact on the surface spin-polarization of the FM. Nevertheless, the wide range of work functions achievable and the in general favorable magnetic properties make these HOI potentially useful as spin injecting / spin detecting contacts.</p>	<p>LiU, UNIKL</p> <p><b>Scientific Impact:</b> Revealed that TCNQ and TNAP adlayers have no detrimental influence on the spin polarization, while changing significantly the current injection. Vice versa, the AOB adlayers reduce the spin polarization</p> <p><b>Application Impact:</b> Crucial technological information for devise fabrication.</p>
	<p>Spin transfer through self-assembled monolayers in a</p>	<p>CNRS, Thales, UVEG</p>

WP3		
Selected results	Brief description	Partners involved
	<p>nanocontact</p> <p>A lithography process has been developed to fabricate nano-scale vertical systems where molecules are connected to ferromagnetic leads. This technique allows probing HOI interfaces at the nanoscale. Nanolithography based on real time electrically controlled nano-indentation has been used to fabricate LSMO/SAMs/Co magnetic tunnel junctions where SAMs are alkyl-acid phosphonic Self-Assembled Monolayers. Lateral size of the devices can vary from few nm to few tenth nm. Electrical characterizations show that not short-circuited nano-junctions can be achieved. This technique is quite versatile since different kind of ferromagnetic electrodes and molecules can be used. Magnetoresistance signal up to 40% has been measured and is comparable to the best organic spin valves. Hence spin dependent transport reveals an efficient spin transfer at HOI interfaces using Self-assembled monolayers grafted on a ferromagnetic electrode. This shows the potential of SAMs for future chemically tailored and engineered spintronics applications while opening the door to additional molecular electronics functionalities.</p> <p><b>Advanced Materials</b> 24, 6429 (2012)</p>	<p><b>Scientific Impact:</b> Efficient spin transfer at HOI interfaces using Self-assembled monolayers grafted on a ferromagnetic electrode</p> <p><b>Application Impact:</b> This shows the potential of SAMs for future chemically tailored and engineered spintronics applications while opening the door to additional molecular electronics functionalities.</p>
	<p>HOIMs featuring efficient spin transfer at high operation bias voltages</p> <p>Spin transfer at hybrid inorganic/organic interface has been probed by tunnelling magnetoresistance experiments in Self-Assembled Monolayers (SAMs) based magnetic tunnel junctions. The self-assembled monolayers are alkyl phosphonic acids grafted on a half metallic LSMO electrode (D1.2). LSMO/C12PO3H2/Co magnetic tunnel junctions have been fabricated using the nano-indentation technique (D1.6). Figures a-b represent the bias voltage dependence of the tunnel magnetoresistance and two examples of magnetoresistance curves recorded at low (10 mV) and high (4 V) bias voltage. A striking point is the very weak decrease (~25 %) of the tunnel magnetoresistance with the bias voltage. Actually at a voltage as large as 4 V the tunnel magnetoresistance is still about 22%. The high tunnel magnetoresistance ratio at such high bias voltage is a unique feature of these HOI based magnetic tunnel junctions where molecular vibrations plays a crucial and beneficial role since they can short-circuit magnon excitations that usually affect inorganic systems. These measurements demonstrate an efficient spin transfer at these hybrid inorganic/organic interfaces and reveal the potential of SAMs as spin injector working at high bias voltage. This could be a key enabler for future applications such as spin-OLEDs where the spin current is expected to drastically improve the OLED efficiency.</p> <p><b>Advanced Materials</b> 24, 6429 (2012)</p>	<p>CNRS, Thales, UVEG</p> <p><b>Scientific Impact:</b> Efficient spin transfer at HOI interfaces: revealed the potential of SAMs as spin injector working at high bias voltage.</p> <p><b>Application Impact:</b> Possible key enabler for future applications such as spin-OLEDs where the spin current is expected to drastically improve the OLED efficiency.</p>

	<p>Magnetoresistance at high bias voltage in H2PC-based organic spin-valves</p> <p>Magnetoresistance (MR) is observed in vertical organic spin valves consisting of a LSMO and a Co electrode and the metal-free phthalocyanine H2PC. The devices undergo a strong resistance increase (approximately 3 orders of magnitude) during cool down to 4.2K (see Fig. a) indicating that the resistance is dominated by the charge transfer through the H2PC-layer. In addition to the spin-valve signal (see Fig. b) which has a magnitude of <math>\approx 8\%</math> at low bias and is persistent to bias voltages of up to <math>\pm 8V</math> (see Fig. c) we also have identified a sizeable contribution of tunneling anisotropic magnetoresistance (TAMR) to the MR effect (see phiscan measurement in Fig. d). The bias dependence of the TAMR is comparable to this of the spin-valve signal with a maximum of <math>\approx 2.5\%</math> at 0V. The observation of TAMR suggests that, despite the strong temperature dependence of R, tunneling processes still have a measureable influence on the device resistance and the magnetotransport behaviour in the low bias regime.</p>	<p>MLU</p> <p><b>Scientific Impact:</b> Innovative, very important for the further understanding of the physics behind MR in organic spin valves</p> <p><b>Application Impact:</b> The realization of structures exhibiting MR at bias voltages in the <math>&gt; \pm 3V</math> regime basically is mandatory for a successful implementation in applications</p>
	<p>Magnetoresistance up to 3-4 percent was established at voltages as high as 11 V, exceeding by far the HINTS objective of 3-5 V. Noteworthy this magnetoresistance was detected in OLED devices at currents and voltages corresponding to light emission. The result opens the possibility to promote efficient studies of the capability to modify light emission in organic based LEDs by spin polarized injection.</p>	<p>UVEG, CNR</p> <p><b>Scientific Impact:</b> A different type of multifunctional devices: magneto-optical. HOI with high voltage operation demonstrated.</p> <p><b>Application Impact:</b> Spin polarised injection is expected to improve OLEDs efficiency (double for singlet emission)</p>

	<p>Lateral organic spin-valves fabricated by shadow evaporation</p> <p>A novel fabrication process has been developed, improved and established that allows for the in-situ fabrication of lateral organic spin valves with a channel length in the sub-100nm regime. The process' key step is a shadow evaporation process which is illustrated in Fig. a and b. Preliminary experiments have been undertaken in order to verify that all requirements for spin-valve functionality are met, e.g. different coercive fields of the two electrodes (see MOKE measurements in Fig. c). The contacts' separation has been checked by imaging methods (see Fig. d) and indirectly by transport measurements. In devices employing the organic semiconductor N,N'-bis(Heptafluorobutyl)-3,4:9,10-Perylene Diimide (PTCDI-C4F7) we have measured a spin-valve-like magnetoresistance effect of up to <math>\approx 50\%</math> (see Fig. e and f) at room temperature which can be explained by lateral tunneling.</p> <p><b>Organic Electronics</b> 14, 2082 (2013)</p>	<p>MLU</p> <p><b>Scientific Impact:</b> devices which do not suffer from side effects like a reduction of the organic interlayer's thickness</p> <p><b>Application Impact:</b> realization of lateral spin-valve structures is an important step towards the implementation of non-volatile switching to the established organic field effect transistor technology</p>
	<p>Resistive switching in AIQ3-based TAMR devices</p> <p>A resistive switching (RS) effect going beyond common bipolar switching has been observed in AIQ3-based single-sided vertical spin valves (tunneling anisotropic magnetoresistance, TAMR, structures with only one ferromagnetic LSMO electrode). The RS (see Fig. a) is initiated by short voltage pulses and allows for setting the device resistance in the range between <math>\approx 1\text{k}\Omega</math> (base resistance state, BRS) and a maximum of <math>\approx 120\text{k}\Omega</math> (high resistance state, HRS). Magnetotransport measurements have been performed in this resistance range revealing a strong increase of the TAMR magnitude when the device resistance is increased (Fig. b). Based on the results of further studies (Simmons analysis of I/V characteristics, see Fig. c and d) a modification of the tunnel barrier which is located between the LSMO electrode and the AIQ3-layer can be identified as the origin of the MR effect's enhancement. Furthermore, among other experiments, a similar analysis has been undertaken for a complete RS cycle in order to investigate the barrier parameters' dynamics caused by the applied voltage pulses (Fig. e). In all results of I/V analysis an increase/decrease in barrier thickness/height (<math>d_{\text{barrier}}/\Phi</math>) with increasing device resistance (and vice versa) can be discerned suggesting very basic mechanisms behind the RS, which very likely are creation, motion and removal of oxygen vacancies at the LSMO electrode's surface.</p>	<p>MLU</p> <p><b>Scientific Impact:</b> TAMR can be employed as a powerful tool for the investigation of interfaces and interface-related effects</p> <p><b>Application Impact:</b> realization of another class of promising multifunctional devices</p>

	<p>conventional metallic ferromagnetic electrodes (Co, Fe, Ni...) having high Curie temperature well above room temperature. Co/Alq<sub>3</sub>/Co organic spin valves were fabricated in-situ by shadow mask. Inverse magnetoresistance was obtained at room temperature. This was ascribed to a strong hybridization (HOI) sustaining up to room temperature as an inverse magnetoresistance in spin valves with identical ferromagnetic electrodes implies that the spin polarization is inverted at one of the two interfaces. This was further confirmed as, by inserting a tunnel barrier at the bottom interface to suppress the hybridization (HOI), normal magnetoresistance was then observed. This demonstrates that the hybridization is strong enough to be observed at room temperature and unveils the potential of HOI for room temperature applications.</p>	<p>Demonstrated that the hybridization is strong enough at room temperature</p> <p><b>Application Impact:</b> Potential of HOI for room temperature applications.</p>

<p>DFT with no-spin-orbit term included: PDOS (Arb. Units) vs E-E<sub>F</sub> (eV) for m<sub>x</sub>, m<sub>y</sub>, and m<sub>z</sub> components.</p> <p>DFT with spin-orbit term included: PDOS (Arb. Units) vs E-E<sub>F</sub> (eV) for m<sub>x</sub>, m<sub>y</sub>, and m<sub>z</sub> components. Includes a diagram of the Alq3 molecule on the Co(001) surface.</p>	<p>Enhanced spin-orbit coupling in molecules at the interface with a ferromagnetic metal. For the interface between fcc Co(001) and Alq<sub>3</sub>, we have found (through density functional theory calculations) a small, but still non-zero, spin-polarization induced even on molecules very weakly coupled to the surface. This is shown in the left panel of the picture, where the spin-resolved density of states (DOS) for the LUMO of an Alq<sub>3</sub> molecule is displayed. Therefore, we infer that spinterface effects are non-negligible also for molecules in the second layer of an organic film deposited on a ferromagnetic metal. Even more interestingly, we have found that the DOS presents comparable non-collinear components when the spin-orbit coupling is explicitly included in the calculation (right panel of the picture). As the Co(001) is a surface with a relatively large spin-orbit coupling strength (in fact spin hot spots have been extensively studied for this surface), the small hybridization is able to enhance the spin-orbit coupling strength in the molecule itself (we note that the intrinsic spin-orbit coupling strength of gas-phase Alq<sub>3</sub> is so small that can not even be numerically resolved in calculations). In future, more systematic studies for different class of molecules may be performed.</p>	<p>TCD, UNIKL</p> <p><b>Scientific Impact:</b> Elucidates the enormous role of the spin-orbit coupling at HOI interfaces.</p> <p><b>Application Impact:</b> Promotes routes for the modification of magnetic anisotropy and other magnetic parameters in thin ferromagnetic films by depositing top organic layers- mild engineering of key magnetic properties.</p>

	<p>Spin-relaxation mechanisms at the interface. Several models describing spin-relaxation mechanisms at hybrid interfaces have been investigated during the project. To our knowledge, no previous study has ever addressed this problem from a microscopic point of view, while most of the research efforts have been dedicated to understand spin relaxation in bulk organic semiconductors. Here, we have shown that the spin-relaxation dynamics for an electron transfer process through an interface can be very complex, even in the absence of spin-orbit and hyperfine interaction. For example, the electron-vibron coupling can lead to charge trapping in the organic right at the interface. Then the net spin polarization of the trapped electrons decays to zero way before these electrons pass through the interface.</p> <p>The two graphs display the time evolution of the spin-dependent occupation probability of a molecular state coupled to a metal. For zero electron-vibron coupling, this probability decays with a constant determined by the coupling with metal. In contrast, when the electron-vibron coupling is non-zero, the decay becomes several orders of magnitude slower, while at a characteristic time (indicated by the arrow) the net spin-polarization becomes zero.</p> <p>We think that, in future, more studies should be devoted to unravel the spin-relaxation mechanism directly at the interface.</p>	<p>TCD</p> <p><b>Scientific Impact:</b> Deep and new knowledge in relation to spin-relaxation processes.</p> <p><b>Application Impact:</b> Significant step towards the control of spin transport in future devices.</p>
	<p>A multiscale theoretical scheme to compute material-specific charge and spin transport properties of organic semiconductors has been developed. This scheme has been extensively applied in order to study crystalline rubrene. Highly anisotropic transport properties have been found (left panel of the picture) and, moreover, the obtained value for the charge carrier mobility is in good agreement with the highest estimate, which was reported in experiments. Furthermore, we could compute the spin-relaxation length (right panel of the picture). By including both the spin-orbit and the hyperfine interaction, a good agreement between our computed value and the experimental estimate has been achieved. More importantly, the spin-diffusion length <math>l_s</math> is found to be independent on the temperature for zero-spin orbit coupling. In contrast <math>l_s</math> decreases with the temperature when the spin-orbit coupling is not neglected. Our results then suggest that the analysis of the temperature dependence of the spin-diffusion length can be used as a mean to investigate the relative importance of the spin-orbit coupling and of the hyperfine interaction in the spin transport properties of (crystalline) organic semiconductors. This would finally help to address the long-debated issue about the origin of spin-relaxation</p>	<p>TCD</p> <p><b>Scientific Impact:</b> Developed the most advanced multiscale theoretical scheme able to compute charge and spin transport properties in HOI and organic materials.</p> <p><b>Application Impact:</b> Important step towards the "on need" developed and fabricated materials for Spintronics.</p>

<p>FIGURE CONFIDENTIAL</p>	<p>in organic materials.</p> <p>Moving beyond the ferromagnetic electrodes' age: exploring novel materials</p> <p>Until recently, most of the studies in organic spintronics have investigated hybrid interfaces between ferromagnetic metal and organic semiconductors. Usually, a hybrid interface is engineered through a careful selection of the organic molecules. Here, instead, we have investigated theoretically (by mean of density functional theory calculations) the impact of different classes of inorganic materials. For example, we have considered the interface formed by absorbing different molecules on the 3D topological insulator, Bi<sub>2</sub>Se<sub>3</sub>. We have found three different physical scenarios, exemplified in the picture by plotting the (molecule and surface) density of states (DOS) resolved in reciprocal space. For weakly coupled molecules (top panel), no change in the electronic structure neither of Bi<sub>2</sub>Se<sub>3</sub> nor of the molecule is seen. For molecules in an intermediate coupling regime (central panel), the electronic structure of Bi<sub>2</sub>Se<sub>3</sub> is unchanged, while a hybrid interface state appears. Finally, for the case of strongly coupled molecules, Bi<sub>2</sub>Se<sub>3</sub> still preserves its topological nature although the electronic structure changes visibly. Furthermore, and more importantly, the typical features of the topological insulator are seen also on the molecule DOS.</p> <p>The first two scenarios (weak and intermediate coupling) have been observed also experimentally by UNIKL. For the third case, an experimental proof is not available yet.</p> <p>Finally, we think that, if a suitable molecule able to form a strong chemical bond with Bi<sub>2</sub>Se<sub>3</sub> was identified, a novel hybrid interface could be made thus opening the route to completely unexplored applications for spin-injection /detection .</p>	<p>TCD, UNIKL</p> <p><b>Scientific Impact:</b> Extremely innovative knowledge on the use of topological insulators in spintronics.</p> <p><b>Application Impact:</b> Step towards new, naturally cheaper electrodes (rare earth free)</p>
<p> <math display="block">MR = \frac{-B/B_m + \eta[1 - \exp(-B^2/B_s^2)]}{1 + B/B_m + \eta \exp(-B^2/B_s^2)}</math>  </p>	<p>Hopping Magnetotransport via Nonzero Orbital Momentum States and Organic Magnetoresistance</p> <p>The theory of hopping magnetoresistance was extended to states with nonzero orbital momenta. Different from s states, a weak magnetic field expands the electron (hole) wave functions with positive magnetic quantum numbers, <math>m &gt; 0</math>, and shrinks the states with negative <math>m</math> in a wide region outside the point defect. This together with a magnetic-field dependence of injection/ionization rates results in a negative weak-field magnetoresistance, which is linear in <math>B</math> when the orbital degeneracy is lifted. The theory provides a possible explanation of a large low field magnetoresistance in disordered conjugated organic materials.</p> <p><b>PRL 108, 186601 (2012)</b></p>	<p>JSI, CNR</p> <p><b>Scientific Impact:</b> Revealing the presence of magnetoresistance in hopping transport in general.</p> <p><b>Application Impact:</b> Enabling possible field dependent correction in devices based on hopping conductivity.</p>

	<p>Magnetoresistance in organic spintronic devices: the role of nonlinear effects.</p> <p>A full set of kinetic equations was derived describing injection and transport of spin polarized carriers in organic semiconductors with hopping conductivity via an impurity level. The model predicts a strongly voltage dependent magnetoresistance defined as resistance variation between devices with parallel and antiparallel electrode magnetizations (spin valve effect). Namely, the voltage dependence of the magnetoresistance splits into three distinct regimes. The first regime matches well known inorganic spintronic regimes, corresponding to barrier controlled spin injection or the conductivity mismatch case. The second regime at the intermediate voltages corresponds to strongly suppressed magnetoresistance. The third regime develops at higher voltages and accounts for a novel and purely organic paradigm. It is promoted by strongly non-linear effects in organic semiconductor which strength is characterized by the dimensionless parameter <math>eU/kBT</math>. This nonlinearity, depending on device conditions, can lead to both significant enhancement or to exponential suppression of the spin-valve effect in organic devices.</p> <p><i>Paper submitted 2014</i></p>	<p>JSI, CNR</p> <p><b>Scientific Impact:</b> Conceptually new approach proposed to circumvent conductivity mismatch problem in spintronics by making use of non-linear carrier transport. 	<p><b>OME 100 Effusion Cell</b></p> <p>The OME 100 Effusion Cell is an advancement of the OME evaporators. It dedicated to the evaporation of sensitive organic materials on large spherical calottes (<math>\varnothing \sim 1</math> m) which are often used in the industrial environment. Due to the large substrates the orifice of the evaporator needs to be large.</p> <p>Besides evaporating the organics from a quartz liner it is possible to evaporate it directly from the copper crucible. The copper crucible can be plated with nickel, gold or silver. Evaporating directly from the copper crucible increases the thermal flow into the organic material. An additional thermocouple positioned in crucible makes it possible to directly measure the temperature of the organic material.</p>	<p>MBE-K</p> <p><b>Application Impact:</b></p> <p><u>The development of the effusion cell is finished and some evaporators are already in use.</u></p> <p>TRL 6-7</p>
	<p><b>OME 63 Effusion Cell</b></p> <p>Like the OME 100 the OME 63 is an advancement of the OME evaporators. It has been developed and build for customers, who evaporate sensitive organics to large substrates (diameter of a few cm) and need a large amount of organics. The effusion cell can be used both for research purposes and industrial applications.</p> <p><u>The development of the effusion cell is finished and some evaporators are already in use.</u></p>	<p>MBE-K</p> <p><b>Application Impact:</b></p> <p><u>The development of the effusion cell is finished and some evaporators are already in use.</u></p> <p>TRL 6-7</p>
	<p><b>Thermostar</b></p> <p>A big difference between the evaporation of organics and metals is the usually much lower thermal conductivity of the organic material. In combination with a large orifice this might lead to a strong temperature gradient within the organic material. While the outer molecules in direct contact with the crucible evaporate with an acceptable rate the rate strongly decreases for molecules in the inner part of the crucible. Therefore the total rate is much lower as possible and also the danger of decomposition of the organics is much higher due to the high gradient of the temperature within the crucible.</p> <p>To increase the thermal conductivity within the organic material the Thermostar was invented. The Thermostar is build of copper sheets arranged in a star shape. The copper sheets can be plated with different materials like gold, nickel and silver. The Thermostar needs to fit to the inner shape of the crucible and the normally used maximum filling level.</p>	<p>MBE-K, MLU</p> <p><b>Application Impact:</b></p> <p>Fabricated an insert to standard commercial crucibles allowing to decrease internal temperature gradients and enhance effusion homogeneity.</p> <p>TRL 5-6</p>

	<p>The investigation on the assessment of new processing technologies has been performed.</p> <p>The main HINTS scientific achievements during the whole project duration and the best materials to fabricate the hybrid interfaces have been collected.</p>	<p>Thales, CNR</p>

## The potential impact and the main dissemination activities and exploitation of results

The potential impact of the HINTS achievements can be evaluated as extremely high.

One of the main achievements of the proposal is the control of the sign of spin transferred polarization. The strength and especially the versatility of this effect in HOI is by far higher than analogue effect detected in inorganic spintronics. The sign inversion gives a magnetoresistance modification  $>100\%$ , what is clearly appealing for device applications. Furthermore, the electrical modulation of the sign has no precedents in inorganic spintronics, and can be at the basis of innovative reconfigurable logic elements.

It can be expected that the extremely efficient control of the spin polarization sign at HOI interfaces may be transferred even into inorganic device area. The rationale for this is supported by the high structural, temperature and chemical stability of the first 1-2 monolayers of organic materials grown on metals or oxides. This option, on the other hand, would not be compatible with inorganic devices requiring epitaxial growth conditions.

The advancement of the spin dependent residence time at the interface and "inside" it (HINTS knowledge and know-how) represents a new way to quantify the spin filtering capability. It has the potential to become the parameter of the future devices based on HOI as well as it can be used in recent close-to-market inorganic devices.

HINTS has established the phenomenological criteria for the detection of the magnetoresistance in HOI based devices, providing thus means for the fabrication of laboratory and industrial devices with desired values of magnetoresistance.

One of the highest impact results is the realization of high voltage operated magnetoresistance. This opens the possibility to use spin polarized carriers at the light emitting voltages in OLEDs or at the operating voltages of OFETs. Thus the organic spintronics can enter for the first time in these two ICT applications, widely employed in display and lightening industries.

Moreover, the achievement of first promising results for the transfer of spintronic achievements on flexible substrates promotes the application of most or part of HINTS results in Large Area Flexible Organic electronics (TOLAE).

Finally, high TRL values have been reached in the tasks involving both research and industrial partners. Two equipment producing partners succeeded to develop useful modifications to their commercial products (at least TRL 6) as stimulated by the needs of HINTS requirements to the interface.

## The address of the project public website, if applicable as well as relevant contact details

The HINTS project is present on the web thanks to its official website: [www.hintsproject.eu](http://www.hintsproject.eu). The website contains the full description of the Project, of its consortium and described the results achieved. Moreover, an intranet has been developed only for the members of the consortium, where they can find the documentation produced during the Project lifetime.

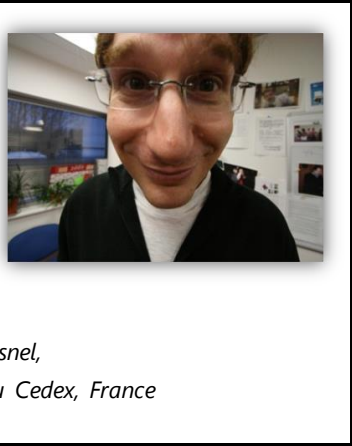

The website will be kept alive on the web for other five years after the end of the project.

The main contacts are listed in table below.

## 2. Use and dissemination of foreground

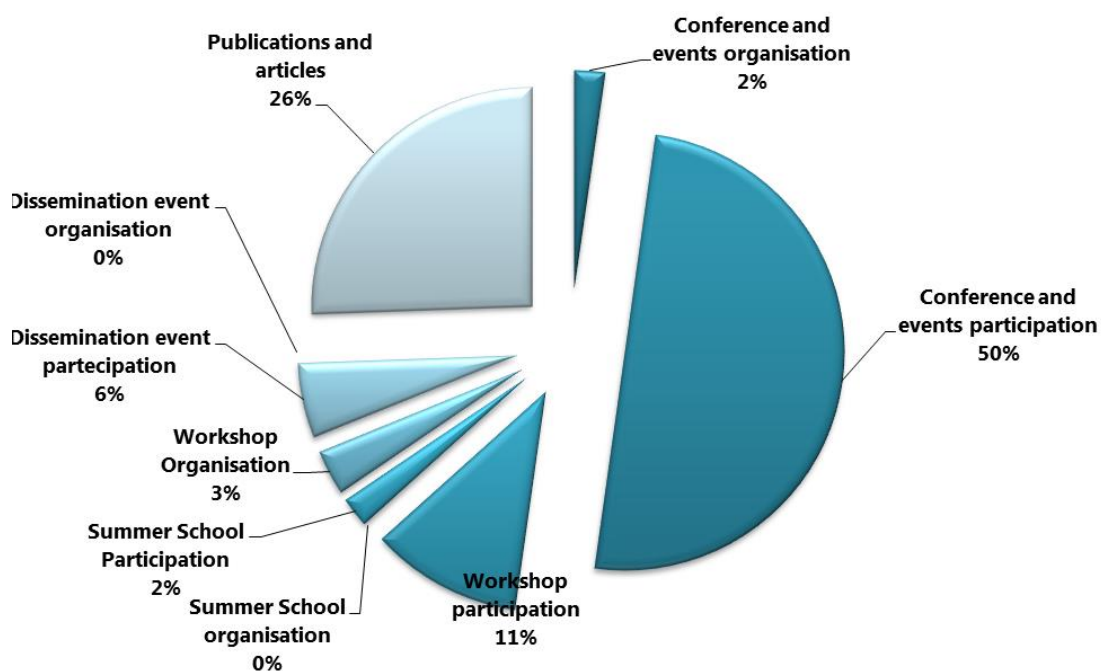

This section includes two tables including all the dissemination actions performed in terms of publications and articles published, and in terms of conferences attended by the partners. Specifically, you will find:

**Table A1:** List of all scientific (peer reviewed) publications relating to the foreground of the project.

**Table A2:** List of all dissemination activities (publications, conferences, workshops, web sites/applications, press releases, flyers, articles published in the popular press, videos, media briefings, presentations, exhibitions, thesis, interviews, films, TV clips, posters).

These tables show all publications and activities from the beginning until after the end of the project. Before introducing the two tables, a qualitative analysis to evaluate the dissemination performed during the entire lifetime of the project has been performed. The results of the assessment are depicted in the graphs and tables below, which are the results of an analysis in terms of quantity, kind of dissemination activities performed and reporting period.

Let's proceed with the dissemination analysis of the first period. In the graph below, the dissemination activities with the highest percentage are those related to the participation on conferences and events (50%) and those related to the workshops' participation (11%). Considerable also is the organisation of workshops (3%) and other dissemination activities participation as for example the publication and press of an article/publication (6%). Instead less influential is the organisation of conferences, events and summer schools' participation (2%). Finally, publications is the second favoured channel to promote the work performed and the results achieved (26%).

**Figure 1-** Dissemination activities performed during the 1st reporting period

	Quantity	%
Conference and events organisation	2	2%
Conference and events participation	45	50%
Workshop participation	10	11%
Summer School organisation	0	0%
Summer School participation	2	2%
Workshop organisation	3	3%
Dissemination event participation	5	6%
Dissemination event organisation	0	0%
Publications and articles	23	26%
<b>Totals</b>	<b>90</b>	

**Table 1-** Quantity of dissemination activities performed in the I reporting period

While, considering the second period, the kind of dissemination activities in which the partners have been more active remain the same of the first period: participation in conferences and events (33%) and workshops' participation (19%). Also during the second reporting period, the workshops' organisations reveal a substantial influence (4%). Moreover, less influential is the organisation of conferences, events and summer schools' participation (3%). Finally, also in the second period, publications is the second favoured channel in which HINTS consortium put a relevant effort in promoting and disseminating its results (39%).

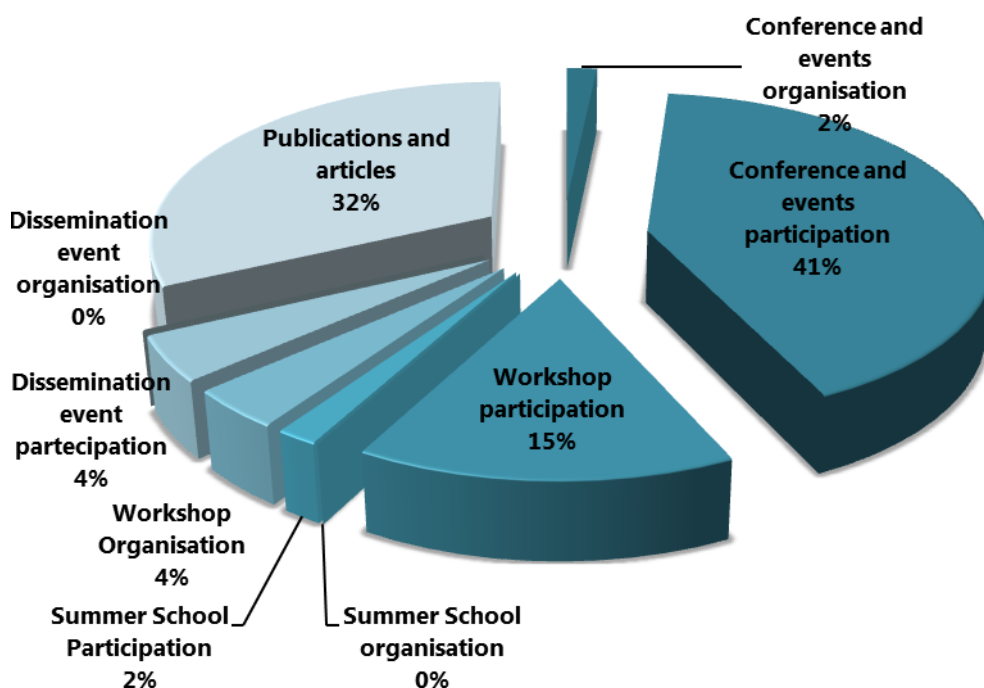

**Figure 2-** Dissemination activities performed during the II reporting period

	Quantity	%
Conference and events organisation	1	1%
Conference and events participation	30	33%
Workshop participation	17	19%
Summer School organisation	0	0%
Summer School participation	1	0%
Workshop organisation	4	4%
Dissemination event participation	3	0%
Dissemination event organisation	0	0%
Publications and articles	35	38%
<b>Totals</b>	<b>91</b>	

**Table 2-** Quantity of dissemination activities performed in the II reporting period

Concluding, the dissemination performed in terms of quantity and kind of activities, is well distributed during the whole course of the project as shown in the figure and in the table below. The kind of dissemination activities in which HINTS partners have been more active is the participation at conferences and other international events, during which the project has been disseminated, as well as the participation at workshops. While publications remains the second favoured channel to promote the work performed and the results achieved.

**Figure 3-** Dissemination activities performed during the whole course of the project in terms of %.

	Quantity	%
Conference and events organisation	3	2%
Conference and events participation	75	41%
Workshop participation	27	15%
Summer School organisation	0	0%
Summer School participation	3	2%
Workshop organisation	7	4%
Dissemination event participation	8	4%
Dissemination event organisation	0	0%
Publications and articles	58	32%
<b>Totals</b>	<b>181</b>	

**Table 3-** *Quantity of dissemination activities performed in the whole course of the project*

HINTS succeeded to establish an impressive list of publications: while a number of papers is still under considerations in various journals and other papers are in preparation, about 58 papers have been published in peer reviewed journals generally with medium, high or very high impact factors. Among these 7 articles published in the Nature Publishing Group, 5 in Advanced Materials and Advanced Functional Materials, and other very important journals such as Chemical Society Reviews, ACS Nano, PRL, MRS Buletin, Nanoscale etc. HINTS publications have attracted a considerable attention of the spintronic and magnetic communities and promoted seminal role in a number of topics, stimulating new research and application interests. Thus, revealing internal interface spin related properties has brought the understanding of interfacial spintronics well beyond the state of the art and even beyond the project expectation. It definitely put Europe in the clear leading role worldwide in spintronic interfacial research. The discovery of the lacking Hanle effect has stimulated a very intense theoretical and experimental research and has the chance to reveal conceptually new effects and device paradigms. Cheap fabrication technologies have been for the first time so massively investigated for organic spintronic devices – and this has been convincingly disseminated and publicized, where available.

**Table A1-** List of all scientific (peer reviewed) publications relating to the foreground of the project

TABLE A1: LIST OF SCIENTIFIC (PEER REVIEWED) PUBLICATIONS, STARTING WITH THE MOST IMPORTANT ONES										
NO	Title	Main author	Journal	Num. date or frequency	Publisher	Place of publication	Year of pub.	Relevant pages	Permanent identifiers <sup>3</sup>	Open access <sup>4</sup>
1	<b>Spin-dependent trapping of electrons at spinterfaces</b>	Steil, S., Großmann, N., Laux, M., Ruffing, A., Steil, D., Wiesenmayer, M., et al.	Nature Physics	Volume 2013, Issue 9 (4), 17/02/2013	Nature Publishing Group	--	2013	242–247	10.1038/nphys2548	No
2	<b>Determination of energy level alignment at metal/molecule interfaces by in-device electrical spectroscopy</b>	M. Gobbi, L. Pietrobon, A. Atxabal, A. Bedoya-Pinto, X. Sun, F. Golmar, R. Llopis, F. Casanova & L. E. Hueso	Nature Communications	5, 20/06/2014	Nature Publishing Group	--	2014	--	10.1038/ncomms5161	No
3	<b>Room-temperature air-stable spin transport in bathocuproine-based spin valves</b>	Xiangnan Sun, Marco Gobbi, Amilcar Bedoya-Pinto, Oihana Txoperena, Federico Golmar, Roger Llopis, Andrey Chuvilin, Fèlix Casanova & Luis E Hueso	Nature Communications	Volume 4 Art number: 2794	Nature Publishing Group	--	2013	--	doi:10.1038/ncomms3794	Yes
4	<b>Organic spintronics: Inside the interface</b>	V. Alek Dediu	Nature Physics	109, 17/02/2013	Nature	--	2013	210–211	doi:10.1038/nphys2569	No

<sup>3</sup> A permanent identifier should be a persistent link to the published version full text if open access or abstract if article is pay per view) or to the final manuscript accepted for publication (link to article in repository).

<sup>4</sup> Open Access is defined as free of charge access for anyone via Internet. Please answer "yes" if the open access to the publication is already established and also if the embargo period for open access is not yet over but you intend to establish open access afterwards.

## **Dissemination activities performed and significant results**

The activities carried out within the framework of the public communication and dissemination have been planned, performed and coordinated by the Project office in collaboration with the Project coordinator, and were carried on with the strong contribution of all the partners. The main objectives achieved during the course of the project have been the following:

building a **distinctive image and style** of the Project in order for HINTS to be easily recognizable.

The design and maintenance of **HINTS Web site**.

The preparation and distribution of various dissemination materials, such as the **posters**, the official **brochure** and the **flyers**.

The production of the **dissemination kit**: several gadgets used for the dissemination have been produced.

The spread of information about HINTS during **local and international events**.

**Publication of scientific articles**.

Publication of the **Project press release** and **external newsletter**.

The dissemination of the Project and its website through the **partners' websites**.

## **The Project visual identity: the LOGO, layouts, dissemination kit and website**

*Figure 4 – HINTS LOGO*

The logo represents the symbol of the spin, the narrows, while the central N represents the interface. All the partners have been provided with the official logo and with the **LOGO policy document**, produce by the Project office from the idea that the power of the logo lies in its consistent and appropriate use. Therefore the document contains the guidelines on its use, standardizing the way the logo could be used within the Project. As far as the Project colours and LOGO have been chosen, the **layout of the official documents** was designed, together with the one of the presentation to be used during the internal Project meetings, and the one for public events. Moreover, starting from the layout of the LOGO, the HINTS **website** was designed and used with the aim of giving the possibility to a wide audience to get information about the Project's contents and initiatives.

The **key issues that were considered in selecting, structuring and writing content for the HINTS website are the following**:

- to provide a comprehensive description of the work that is being conducted;
- to successfully reach the audiences that may have an interest in HINTS potential results;
- to facilitate the exchange of documents and information among the Project partners;

to make the site as transparent as possible, respecting the know-how of the partners that have to be protected.

The website was launched the 16<sup>th</sup> December 2011 (month 7 of the Project) and it can be accessed at <http://www.hintsProject.eu>. The private area has been developed in a second stage to offer the repository and access point for Project-related information, for use by the Project partners and of the reviewers.

An external newsletter has been created to spread information on the project. The **e-newsletter**, which has been created by the Project office with the collaboration of the whole consortium, included several information on the Project, and about the scientific community which is part of the consortium. The newsletter is downloadable from the HINTS website, where it is also possible for external users, to subscribe to the service. The first newsletter has been published in June 2012 (Month 13), while the last issue has been published at the end of the project. The newsletter is shown in the picture below.

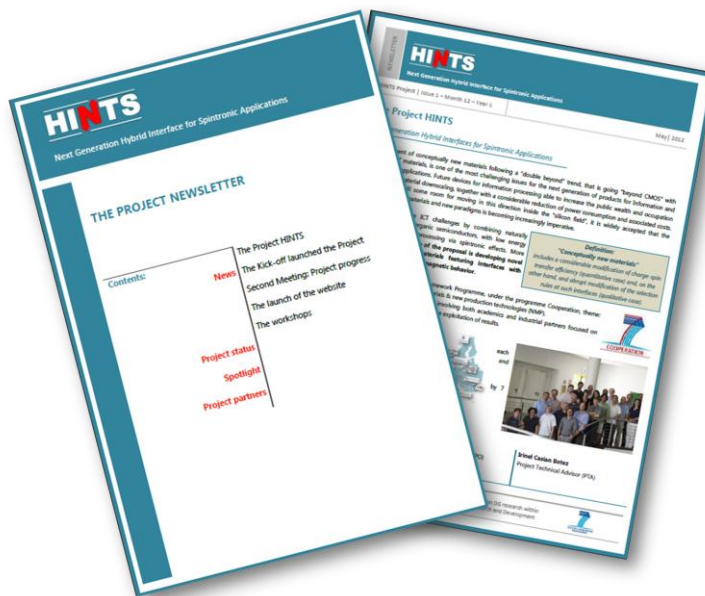

Figure 5 – HINTS e-newsletter

During the course of the project, the consortium has laid the foundations to take part at important public events to promote the Project and its results, producing an efficient **dissemination kit**. In order to be ready to disseminate the Project to external audience, the Project's the brochure, the flyers and the posters were designed by the Project office and approved by the partners.

The **Project brochure** has been designed at the beginning of the Project and finally approved in May 2012. It consists of two sheets of A4 folded, in HINTS style. The external covering pages accommodate the general Project information and contact details. The internal pages describe the Project's aims and objectives.

The brochure has been uploaded in a dedicated page in the website, and several copies have been printed and distributed among the partners.

**HINTS** Next Generation Hybrid Interfaces for Spintronic Applications

**THE CHALLENGES**

The development of **conceptually new materials** following a “double beyond” trend, that is going “beyond CMOS” with “beyond silicon” materials, is one of the most challenging issues for the next generation of products for Information and Communication applications. Future devices for information processing able to increase the public wealth and occupation require a further material for devices downscaling, together with a considerable reduction of power consumption and associated costs. While there still exists some room for moving in this direction inside the “silicon field”, it is widely accepted that the development of new materials and new paradigms is finally becoming imperative.

**CONCEPTUALLY NEW MATERIALS**

The definition “conceptually new material” includes a considerable modification of charge-spin transfer efficiency (quantitative case) and, on the other hand, an abrupt modification of the selection rules at such interfaces (qualitative case).

**GOAL**

The main objective of the project HINTS is to develop novel hybrid organic-inorganic materials featuring interfaces with conceptually new electric and magnetic behavior.

**NUMBERS**

- Started 1<sup>st</sup> June 2011, ending 31<sup>st</sup> May 2014, lasts **36 months**.
- Participation of **14 partners**, from **8 different Member States**.
- 7 Universities, 3 Research Centers and 4 Companies**.
- 44 researchers involved** and **9 young researchers**.
- Funding: 3,874,360.00 €**

**Electronic Nanotech Circuit**

Magnetic field, Voltage, Current, Co 15 nm, AlO<sub>2</sub> 2nm, Al<sub>2</sub>O<sub>3</sub> 2-250 nm, La<sub>0.7</sub>Pr<sub>0.3</sub>AlO<sub>3</sub> 10-15 nm

Project NMP – GA n. 263104 funded by the European Commission through the Seven Framework Programme (7FP)

[www.hintsproject.eu](http://www.hintsproject.eu)

Figure 7 – HINTS brochure: front and back page

**The flyer** has been designed to substitute the brochure in particular cases, where a brief description of the Project is needed, stressing other different aspects. The flyer has been thought to be adapted at the events organized by the consortium, such as the Project workshops, and it recalls the HINTS visual identity.

The flyer produced for a Project workshop has been depicted in the picture below.

Figure 8 – Bled lake workshop Flyer

The dissemination kit includes also several other dissemination material that has been created for the partners, such as the HINTS **folders and the notebooks**. This material has been distributed to the consortium during the Project meetings, and it has been used by the partners to disseminate the project at international events. The choice of what kind of gadgets we could produce, has been based on the low cost, on the effectiveness and usefulness of the gadget itself. The HINTS folders and notebooks are shown in the picture on the right

Figure 9 – folders and notebooks

In order to give homogeneity to the presentations that will be made by the partners during the public events, a common layout of the presentations was designed, and an official Project presentation has been prepared.

Figure 10 – HINTS Presentation layout

Together with the dissemination material and the Project's presentations, the partners have disseminated the Project also through several **posters**, created for particular events and with very detailed contents on the results and the scientific activities performed in the frame of the Project. These posters are available in the Project website, at the dissemination page <http://www.hintsproject.eu/16-eng-poster.html>

## Section B (Confidential<sup>5</sup> or public: confidential information to be marked clearly)

### Part B1

No applications for patents, trademarks, registered designs, etc. have been done during the course of the project.

**Table B1-** List applications for patents, trademarks, registered designs, etc.

TEMPLATE B1: LIST OF APPLICATIONS FOR PATENTS, TRADEMARKS, REGISTERED DESIGNS, ETC.					
Type of IP Rights <sup>6</sup> :	Confidential Click on YES/NO	Foreseen embargo date dd/mm/yyyy	Application reference(s) (e.g. EP123456)	Subject or title of application	Applicant (s) (as on the application)
//	//	//	//	//	//
//	//	//	//	//	//
//	//	//	//	//	//
//	//	//	//	//	//

<sup>5</sup> Note to be confused with the "EU CONFIDENTIAL" classification for some security research projects.

<sup>6</sup> A drop down list allows choosing the type of IP rights: Patents, Trademarks, Registered designs, Utility models, Others.

## Part B2

Type of Exploitable Foreground <sup>7</sup>	Description of exploitable foreground	Confidential	Foreseen embargo date	Exploitable product(s) or measure(s)	Sector(s) of application <sup>8</sup>	Timetable, commercial or any other use	Patents or other IPR exploitation (licences)	Owner & Other Beneficiary(s) involved
Commercial exploitation of R&D results	C25.7.3 - Manufacture of tools Machine for depositing solution based organic molecules in an inert environment	no		Equipment for electronic and spintronic components	Research laboratories, flexible electronics enterprises	Available 2014	confidential	Beneficiary M-SOLV (owner)
Commercial exploitation of R&D results	C25.7.3 - Manufacture of tools Flanges dedicated to the efficient evaporation of organics	no		Equipment for electronic and spintronic components	Research laboratories	Available 2014	confidential	Beneficiary MBE-K (owner)

<sup>19</sup> A drop down list allows choosing the type of foreground: General advancement of knowledge, Commercial exploitation of R&D results, Exploitation of R&D results via standards, exploitation of results through EU policies, exploitation of results through (social) innovation.

<sup>8</sup> A drop down list allows choosing the type sector (NACE nomenclature) : [http://ec.europa.eu/competition/mergers/cases/index/nace\\_all.html](http://ec.europa.eu/competition/mergers/cases/index/nace_all.html)

Type of Exploitable Foreground <sup>9</sup>	Description of exploitable foreground	Confidential	Foreseen embargo date	Exploitable product(s) or measure(s)	Sector(s) of application <sup>10</sup>	Timetable, commercial or any other use	Patents or other IPR exploitation (licences)	Owner & Other Beneficiary(s) involved
Commercial exploitation of R&D results	C25.7.3 - Manufacture of tools Upgraded commercial evaporator for the evaporation of sensitive organic materials on large spherical calottes (Ø ~ 1 m)	no		OME 100 Effusion Cell	Research and industrial laboratories	Available 2014	confidential	Beneficiary MBE-K (owner)
Commercial exploitation of R&D results	C25.7.3 - Manufacture of tools Upgraded commercial evaporator for the evaporation of sensitive organic materials on large flat substrates (of a few cm)	no		OME 63 Effusion Cell	Research and industrial laboratories	Available 2014	confidential	Beneficiary MBE-K (owner)

<sup>19</sup> A drop down list allows choosing the type of foreground: General advancement of knowledge, Commercial exploitation of R&D results, Exploitation of R&D results via standards, exploitation of results through EU policies, exploitation of results through (social) innovation.

<sup>10</sup> A drop down list allows choosing the type sector (NACE nomenclature): [http://ec.europa.eu/competition/mergers/cases/index/nace\\_all.html](http://ec.europa.eu/competition/mergers/cases/index/nace_all.html)

As far as what reported herabove, please find hereunder some more information.

- Its purpose
  - As part of the HINTS project, M-Solv Ltd developed knowhow in the integration of ink jet and spray deposition systems in to glove boxes. These systems can be used for the development and fabrication of organic electronics where moisture and oxygen sensitive materials are used. In particular OLEDs, OPV and spintronics. Further to this processing knowledge was developed in high accuracy printing and tailoring of processes to create smooth and very flat surfaces with low Ra.
  - MBE-K has concentrated its efforts on the modification of various UHV film growth components, among which the main goals were to bring the effusion cells to a higher efficiency and lower molecular consumption.
- How the foreground might be exploited, when and by whom
  - The knowhow developed has lead to the sale of a glove box system with integrated spray system to one of the top universities in the country. This sale is worth EUR 500k. Further to this M-Solv is in the process of adding glove box R&D systems with integrated spray, ink jet and laser systems directed at large area printed electronics and hybrid processing to its line of systems that it provides.
  - HINTS has pushed for a new industrial research at the MBE-K, resulting in the modification of commercial effusion cells and other complementary products delivered mainly to research laboratories. Resulting improvements will be partially implemented in serial or customized products.
- IPR exploitable measures taken or intended
  - N/A
- Further research necessary, if any
  - N/A
- Potential/expected impact (quantify where possible)
  - Participation in the HINTS project has lead M-Solv and MBE-K to offer new equipment to their customers. This will lead to an increase in specialist machine and UHV equipment sales not only within Europe, but outside Europe as well.

## Report on societal implications

### A General Information *(completed automatically when Grant Agreement number is entered.*

Grant Agreement Number:

Title of Project:

Name and Title of Coordinator:

### B Ethics

#### 1. Did your project undergo an Ethics Review (and/or Screening)?

If Yes: have you described the progress of compliance with the relevant Ethics Review/Screening Requirements in the frame of the periodic/final project reports?

Special Reminder: the progress of compliance with the Ethics Review/Screening Requirements should be described in the Period/Final Project Reports under the Section 3.2.2 'Work Progress and Achievements'

**No**

#### 2. Please indicate whether your project involved any of the following issues (tick box) :

##### RESEARCH ON HUMANS

Did the project involve children?	<b>No</b>
Did the project involve patients?	<b>No</b>
Did the project involve persons not able to give consent?	<b>No</b>
Did the project involve adult healthy volunteers?	<b>No</b>
Did the project involve Human genetic material?	<b>No</b>
Did the project involve Human biological samples?	<b>No</b>
Did the project involve Human data collection?	<b>No</b>

##### RESEARCH ON HUMAN EMBRYO/FOETUS

Did the project involve Human Embryos?	<b>No</b>
Did the project involve Human Foetal Tissue / Cells?	<b>No</b>
Did the project involve Human Embryonic Stem Cells (hESCs)?	<b>No</b>
Did the project on human Embryonic Stem Cells involve cells in culture?	<b>No</b>
Did the project on human Embryonic Stem Cells involve the derivation of cells from Embryos?	<b>No</b>

##### PRIVACY

Did the project involve processing of genetic information or personal data (eg. health, sexual lifestyle, ethnicity, political opinion, religious or philosophical conviction)?	<b>No</b>	
Did the project involve tracking the location or observation of people?	<b>No</b>	
<b>RESEARCH ON ANIMALS</b>		
Did the project involve research on animals?	<b>No</b>	
Were those animals transgenic small laboratory animals?	<b>No</b>	
Were those animals transgenic farm animals?	<b>No</b>	
Were those animals cloned farm animals?	<b>No</b>	
Were those animals non-human primates?	<b>No</b>	
<b>RESEARCH INVOLVING DEVELOPING COUNTRIES</b>		
Did the project involve the use of local resources (genetic, animal, plant etc)?	<b>No</b>	
Was the project of benefit to local community (capacity building, access to healthcare, education etc)?	<b>No</b>	
<b>DUAL USE</b>		
Research having direct military use	<b>No</b>	
Research having the potential for terrorist abuse	<b>No</b>	
<b>C Workforce Statistics</b>		
<b>3. Workforce statistics for the project: Please indicate in the table below the number of people who worked on the project (on a headcount basis).</b>		
<b>Type of Position</b>	<b>Number of Women</b>	<b>Number of Men</b>
Scientific Coordinator	2	5
Work package leaders	8	16
Experienced researchers (i.e. PhD holders)	4	13
PhD Students	2	4
Other	3	9
<b>4. How many additional researchers (in companies and universities) were recruited specifically for this project?</b>	6	
Of which, indicate the number of men:	4	

## D Gender Aspects

5. Did you carry out specific Gender Equality Actions under the project?

Yes  
 No

6. Which of the following actions did you carry out and how effective were they?

	Not at all effective	Very effective
<input type="checkbox"/> Design and implement an equal opportunity policy	<input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/>	<input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/>
<input type="checkbox"/> Set targets to achieve a gender balance in the workforce	<input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/>	<input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/>
<input type="checkbox"/> Organise conferences and workshops on gender	<input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/>	<input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/>
<input type="checkbox"/> Actions to improve work-life balance	<input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/>	<input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/> <input type="radio"/>
<input checked="" type="radio"/> Other:	Several measures were taken to guarantee the attendance of project meetings by women with little children.	

7. Was there a gender dimension associated with the research content – i.e. wherever people were the focus of the research as, for example, consumers, users, patients or in trials, was the issue of gender considered and addressed?

Yes- please specify

No

## E Synergies with Science Education

8. Did your project involve working with students and/or school pupils (e.g. open days, participation in science festivals and events, prizes/competitions or joint projects)?

Yes- please specify

No

9. Did the project generate any science education material (e.g. kits, websites, explanatory booklets, DVDs)?

Yes- please specify

No

## F Interdisciplinarity

10. Which disciplines (see list below) are involved in your project?

Main discipline<sup>11</sup>: 1.3

Associated discipline<sup>11</sup>: 2.3 |  Associated discipline<sup>11</sup>:

<sup>11</sup> Insert number from list below (Frascati Manual).

<b>G Engaging with Civil society and policy makers</b>			
<b>11a Did your project engage with societal actors beyond the research community?</b> <i>(if 'No', go to Question 14)</i>		<input type="radio"/> <input checked="" type="radio"/>	Yes No
<b>11b If yes, did you engage with citizens (citizens' panels / juries) or organised civil society (NGOs, patients' groups etc.)?</b> <ul style="list-style-type: none"> <li><input checked="" type="radio"/> No</li> <li><input type="radio"/> Yes- in determining what research should be performed</li> <li><input type="radio"/> Yes - in implementing the research</li> <li><input type="radio"/> Yes, in communicating /disseminating / using the results of the project</li> </ul>			
<b>11c In doing so, did your project involve actors whose role is mainly to organise the dialogue with citizens and organised civil society (e.g. professional mediator; communication company, science museums)?</b>		<input type="radio"/> <input type="radio"/>	Yes No
<b>12. Did you engage with government / public bodies or policy makers (including international organisations)</b>			
<ul style="list-style-type: none"> <li><input checked="" type="radio"/> No</li> <li><input type="radio"/> Yes- in framing the research agenda</li> <li><input type="radio"/> Yes - in implementing the research agenda</li> <li><input type="radio"/> Yes, in communicating /disseminating / using the results of the project</li> </ul>			
<b>13a Will the project generate outputs (expertise or scientific advice) which could be used by policy makers?</b>			
<ul style="list-style-type: none"> <li><input type="radio"/> Yes – as a <b>primary</b> objective (please indicate areas below- multiple answers possible)</li> <li><input type="radio"/> Yes – as a <b>secondary</b> objective (please indicate areas below - multiple answer possible)</li> <li><input checked="" type="radio"/> No</li> </ul>			
<b>13b If Yes, in which fields?</b>			
Agriculture Audiovisual and Media Budget Competition Consumers Culture Customs Development Economic and Monetary Affairs Education, Training, Youth Employment and Social Affairs	Energy Enlargement Enterprise Environment External Relations External Trade Fisheries and Maritime Affairs Food Safety Foreign and Security Policy Fraud Humanitarian aid	Human rights Information Society Institutional affairs Internal Market Justice, freedom and security Public Health Regional Policy Research and Innovation Space Taxation Transport	

<b>13c If Yes, at which level?</b> <ul style="list-style-type: none"> <li><input type="radio"/> Local / regional levels</li> <li><input type="radio"/> National level</li> <li><input type="radio"/> European level</li> <li><input type="radio"/> International level</li> </ul>		
<b>H Use and dissemination</b>		
<b>14. How many Articles were published/accepted for publication in peer-reviewed journals?</b>	59	
<b>To how many of these is open access<sup>12</sup> provided?</b>	15	
<b>How many of these are published in open access journals?</b>	None	
<b>How many of these are published in open repositories?</b>	None	
<b>To how many of these is open access not provided?</b>	44	
<b>Please check all applicable reasons for not providing open access:</b>		
<input type="checkbox"/> publisher's licensing agreement would not permit publishing in a repository <input type="checkbox"/> no suitable repository available <input type="checkbox"/> no suitable open access journal available <input checked="" type="checkbox"/> no funds available to publish in an open access journal <input checked="" type="checkbox"/> lack of time and resources <input type="checkbox"/> lack of information on open access <input type="checkbox"/> other <sup>13</sup> : .....		
<b>15. How many new patent applications ('priority filings') have been made?</b> ( <i>"Technologically unique": multiple applications for the same invention in different jurisdictions should be counted as just one application of grant</i> ).	None	
<b>16. Indicate how many of the following Intellectual Property Rights were applied for (give number in each box).</b>	Trademark	NA
	Registered design	NA
	Other	NA
<b>17. How many spin-off companies were created / are planned as a direct result of the project?</b>	None	
<i>Indicate the approximate number of additional jobs in these companies:</i>	NA	
<b>18. Please indicate whether your project has a potential impact on employment, in comparison with the situation before your project:</b>		
<input type="checkbox"/> Increase in employment, or <input type="checkbox"/> Safeguard employment, or	<input type="checkbox"/> In small & medium-sized enterprises <input type="checkbox"/> In large companies	

<sup>12</sup> Open Access is defined as free of charge access for anyone via Internet.

<sup>13</sup> For instance: classification for security project.

<input type="checkbox"/> Decrease in employment, <input type="checkbox"/> Difficult to estimate / not possible to quantify	x	None of the above / not relevant to the project		
<b>19. For your project partnership please estimate the employment effect resulting directly from your participation in Full Time Equivalent (FTE = one person working fulltime for a year) jobs:</b>  Not possible to quantify		<i>Indicate figure:</i>  <input type="checkbox"/>		
<b>I Media and Communication to the general public</b>				
<b>20. As part of the project, were any of the beneficiaries professionals in communication or media relations?</b> <input checked="" type="radio"/> Yes <input type="radio"/> No				
<b>21. As part of the project, have any beneficiaries received professional media / communication training / advice to improve communication with the general public?</b> <input type="radio"/> Yes <input checked="" type="radio"/> No				
<b>22 Which of the following have been used to communicate information about your project to the general public, or have resulted from your project?</b> <table border="0" style="width: 100%;"> <tr> <td style="width: 50%; vertical-align: top;"> <input checked="" type="checkbox"/> Press Release  <input type="checkbox"/> Media briefing  <input type="checkbox"/> TV coverage / report  <input type="checkbox"/> Radio coverage / report  <input checked="" type="checkbox"/> Brochures /posters / flyers  <input type="checkbox"/> DVD /Film /Multimedia         </td> <td style="width: 50%; vertical-align: top;"> <input type="checkbox"/> Coverage in specialist press  <input type="checkbox"/> Coverage in general (non-specialist) press  <input type="checkbox"/> Coverage in national press  <input type="checkbox"/> Coverage in international press  <input checked="" type="checkbox"/> Website for the general public / internet  <input checked="" type="checkbox"/> Event targeting general public (festival, conference, exhibition, science café)         </td> </tr> </table>			<input checked="" type="checkbox"/> Press Release <input type="checkbox"/> Media briefing <input type="checkbox"/> TV coverage / report <input type="checkbox"/> Radio coverage / report <input checked="" type="checkbox"/> Brochures /posters / flyers <input type="checkbox"/> DVD /Film /Multimedia	<input type="checkbox"/> Coverage in specialist press <input type="checkbox"/> Coverage in general (non-specialist) press <input type="checkbox"/> Coverage in national press <input type="checkbox"/> Coverage in international press <input checked="" type="checkbox"/> Website for the general public / internet <input checked="" type="checkbox"/> Event targeting general public (festival, conference, exhibition, science café)
<input checked="" type="checkbox"/> Press Release <input type="checkbox"/> Media briefing <input type="checkbox"/> TV coverage / report <input type="checkbox"/> Radio coverage / report <input checked="" type="checkbox"/> Brochures /posters / flyers <input type="checkbox"/> DVD /Film /Multimedia	<input type="checkbox"/> Coverage in specialist press <input type="checkbox"/> Coverage in general (non-specialist) press <input type="checkbox"/> Coverage in national press <input type="checkbox"/> Coverage in international press <input checked="" type="checkbox"/> Website for the general public / internet <input checked="" type="checkbox"/> Event targeting general public (festival, conference, exhibition, science café)			
<b>23 In which languages are the information products for the general public produced?</b> <input checked="" type="checkbox"/> Language of the coordinator <input checked="" type="checkbox"/> English <input type="checkbox"/> Other language(s)				

**Question F-10:** *Classification of Scientific Disciplines according to the Frascati Manual 2002 (Proposed Standard Practice for Surveys on Research and Experimental Development, OECD 2002):*

## Fields of science and technology

### 1. Natural Sciences

1.1 Mathematics and computer sciences [mathematics and other allied fields: computer sciences and other allied subjects (software development only; hardware development should be classified in the engineering fields)]

1.2 Physical sciences (astronomy and space sciences, physics and other allied subjects)

1.3 Chemical sciences (chemistry, other allied subjects)

1.4 Earth and related environmental sciences (geology, geophysics, mineralogy, physical geography and other geosciences, meteorology and other atmospheric sciences including climatic research, oceanography, vulcanology, palaeoecology, other allied sciences)

1.5 Biological sciences (biology, botany, bacteriology, microbiology, zoology, entomology, genetics, biochemistry, biophysics, other allied sciences, excluding clinical and veterinary sciences)

### 2. Engineering and technology

2.1 Civil engineering (architecture engineering, building science and engineering, construction engineering, municipal and structural engineering and other allied subjects)

2.2 Electrical engineering, electronics [electrical engineering, electronics, communication engineering and systems, computer engineering (hardware only) and other allied subjects]

2.3. Other engineering sciences (such as chemical, aeronautical and space, mechanical, metallurgical and materials engineering, and their specialised subdivisions; forest products; applied sciences such as geodesy, industrial chemistry, etc.; the science and technology of food production; specialised technologies of interdisciplinary fields, e.g. systems analysis, metallurgy, mining, textile technology and other applied subjects)

### 3. Medical Sciences

3.1 Basic medicine (anatomy, cytology, physiology, genetics, pharmacy, pharmacology, toxicology, immunology and immunohaematology, clinical chemistry, clinical microbiology, pathology)

3.2 Clinical medicine (anaesthesiology, paediatrics, obstetrics and gynaecology, internal medicine, surgery, dentistry, neurology, psychiatry, radiology, therapeutics, otorhinolaryngology, ophthalmology)

3.3 Health sciences (public health services, social medicine, hygiene, nursing, epidemiology)

### 4. Agricultural sciences

4.1 Agriculture, forestry, fisheries and allied sciences (agronomy, animal husbandry, fisheries, forestry, horticulture, other allied subjects)

4.2 Veterinary medicine

### 5. Social sciences

5.1 Psychology

5.2 Economics

5.3 Educational sciences (education and training and other allied subjects)

5.4 Other social sciences [anthropology (social and cultural) and ethnology, demography, geography (human, economic and social), town and country planning, management, law, linguistics, political sciences, sociology, organisation and methods, miscellaneous social sciences and interdisciplinary, methodological and historical S1T activities relating to subjects in this group. Physical anthropology, physical geography and psychophysiology should normally be classified with the natural sciences].

## 6. Humanities

6.1 History (history, prehistory and history, together with auxiliary historical disciplines such as archaeology, numismatics, palaeography, genealogy, etc.)

6.2 Languages and literature (ancient and modern)

6.3 Other humanities [philosophy (including the history of science and technology) arts, history of art, art criticism, painting, sculpture, musicology, dramatic art excluding artistic "research" of any kind, religion, theology, other fields and subjects pertaining to the humanities, methodological, historical and other S1T activities relating to the subjects in this group]
