Project description

Growing crops under water-stressed conditions

Climate change is affecting agriculture. For instance, warming temperatures are taking their toll on crop quality and yield worldwide. In this context, the EU-funded RESIST project will explore solutions to reduce water stress in crops. Specifically, it will study the genomes of several resurrection species and compare them with the genomes of desiccation-sensitive plants to identify molecular mechanisms that are involved in drought tolerance. The project will also sequence and analyse two more (*Haberlea rhodopensis* and *Xerophyta humilis*). The overall aim will be to shed light on the nature of drought stress tolerance by studying the comparative transcriptomics, metabolomics and lipidomics of resurrection, model, and crop plants subjected to drought.
